NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

1. PAVE

Pilot: Flew mainly solo for CPL maneuvers & performed T/G's only light weight. Got tired due to studying for knowledge test of A&P.

Aircraft: good condition

Environment: Flight crew added who is over 170 lbs.(Need more power than usual)

External pressure: Limit of practical test of CPL. & INST. came on. (time pressure)

2. Preflight

A/C : good condition

Fuel : 31 gal (left:19/right:12)

Oil : 6.7 quarts

3. Run up

normal

4. T/O

Climb rate was slightly low than usual.

5. Approach

Situation awareness : Traffic over Agana bay & tower said "make short approach"

Turning base earlier than usual before reached runway number

Throttle reduce to 1700 rpm then slow down (airspeed from 80kt to around 65 kt)

Used full flaps then approached with steep angle high descend rate (800 ft/min)

Rounded out level earlier with added more power than usual & waited for sinking

6. Landing

Touched the ground before flaring and bounced but not so hard I felt.

Added more power to prevent hard contact to the ground but not enough

Touched the ground before flaring and bounced too but still kept the aircraft level.

Hesitated to go around at extremely low airspeed & low altitude in these bounds

Getting kinetic & potential energy without recovering enough lift is more danger.

If we've gotten more altitude without enough lift decent & hit the ground harder.

It should be made the aircraft into expanded oscillation like porpoise.

It might be PIO due to lose and over control so it was getting worse the situation.

Nothing to do without waiting for stopping these bounds

Then touched the ground relatively harder and bounced almost vertically.

I felt low G & slight nose down moment in a second and fell vertically.

Hit the ground harder with sound of something broken and stop bouncing.

But I didn't know what happen to the aircraft at that time.

7. After ldg.

Call Agana tower "abort T/O due to flat tire" then contact ground & company.

Prop & E/G worked until stuff coming then shut it down.

Push back the aircraft to south ramp via D-taxiway.

Apply an interview from operation about what happened.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

1. Before flying confirm any kinds of risks (mental, spiritual and physical) .
2. Prevent for building up an error chain to keep those risks from relating each other. (see as shown in below)
3. Operate always in safe side especially heavy weight such as " one bounce makes go around automatically"

Human factor(could not cut off an error chain)

- a) Fatigue due to study for practical test of CPL & knowledge test of A&P.
- b) Flew mainly solo for CPL maneuvers & performed T/G's only light weight
- c) Flight crew added who is over 170 lbs.(Need more power than usual)
- d) Traffic over Agana bay & tower said "make short approach"(time pressure)
- e) Used full flaps then approached with steep angle high descend rate
- f) Rounded out level earlier with added more power than usual then bounce
- g) Added more power to prevent hard contact to the ground but not enough
- h) Hesitated to go around at extremely low airspeed & low altitude.
- i) Then touched the ground relatively harder and bounced almost vertically.
- j) I felt low G & slight nose down moment in a second and fell vertically.
- k) Hit the ground harder with sound of something broken and stop bouncing
