Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft damage consist of a blade strike to the tail boom. Blade damage minimal. There is hole in the top portion of the tail boom where the blade hit. Other damage is to landing gear. Landing gear cross tube slightly bowed from hard landing. There is also slight damage to the lower portion of the mast fairing.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

Departure Point and Point of Intending Landing: KBZN

Approximate Departure Time: 7:58 AM

Activities Performed: Flight Training in the HTA

Training flight started with performing approaches in the HTA to allow the student to get warmed up for flying. Following the approaches, practice autorotations were began. To allow autorotations into the wind, the middle of the East Ramp was selected for the point of intended recovery. The first two autorotations were made with 90° right turns to prepare for the following 180° turn autorotations. After the two 90° autorotations were performed fine, two 180° autorotations were performed. On the following third 180° autorotations is when the event occurred.

The 180° Autorotation was entered normally. During 180° turn, nose attitude became too low, resulting in an increased descent rate. Once turn was completed, nose attitude was still to low and flare was not begun soon enough to stop high descent rate. With the high descent rate, too much altitude was lost to complete a full 180 degree turn to the middle of the east ramp. A normal power-on autorotation recovery was attempted, but a high descent rate combined with a too late of flare did not allow the helicopter to come to a hover. Just before ground contact, forward cyclic was applied to level the helicopter and the collective was raised fully. Ground contact was made with approximately 92% Rotor RPM. After ground contact, the helicopter still had a high forward airspeed from the forward cyclic input such that it slid a large distance across the asphalt and into the grass before coming to a stop.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The event could have been avoided by recovering the autorotation sooner and doing a go-around.
