Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft damaged beyond economic repair. Main rotor strike, tail rotor strike, broken skid at impact. All power and drive train components subjected to significant torque.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On July, 31 2017 the pilot departed Monmouth, IL (C66) at 7:00am CDT and flew to an area near Dunlap, IL. The pilot had completed several Part 137 operations in the area over the proceeding hours and decided to visually inspect the remaining Part 137 operations areas scheduled in that area in order to determine what portions could be completed by the operators fixed wing aircraft. The pilot was also using the opportunity to scout suitable locations for future runway development. During the flight, it was determined that the remainder of the work would be completed using the operators fixed wing aircraft. The pilot radioed the driver of the fuel truck and advised the driver to meet at a suitable, level location, the pilot was circling for additional fuel in order to continue the Part 91 flight. The driver followed the directions to the location, at which time the pilot landed on the fuel truck and the driver began fueling operations. The time was approximately 10:30am (CDT).

During the brief fueling operation the pilot was making notes of the observed area from the previous flight. During this time, the driver connected the chemical fill hose and continued fueling. Upon reaching the desired amount of fuel, the pilot motioned, using hand signals developed between the pilot and driver, that more fuel would be taken after the next flight. The driver removed the fuel hose from the aircraft, stepped away from the aircraft, and upon making eye contact with the pilot gave the "OK" signal which had been used on all previous Part 91 flights requiring a fuel only stop thus indicating the fuel hose was removed, the fuel cap replaced, and the driver was clear of the aircraft for safe departure. The pilot returned the "OK" hand signal and advanced the throttle for departure. It should be noted that for all Part 137 flights a "thumbs up" signal had been used for visual confirmation that the chemical hose was unconnected from the aircraft and all was clear for a safe departure. Being a stop for fuel only and with no expectation of being connected to the chemical fill hose, the pilot, after making eye contact with the driver and seeing the driver had in fact removed the fuel hose and had moved away from the aircraft, assumed all was clear and initiated a departure.

As the aircraft became air born, the pilot heard the driver attempting to stop the pilot and warn the pilot that the aircraft was connected to the chemical hose. Upon hearing the driver, the pilot looked over the right shoulder and observed that the hose had taken the form of a slinky and had become extended beyond the manufactures usable limitations during the attempted departure. The pilot, wishing to terminate the forward momentum, applied aft cyclic at which time the tail rotor struck the fuel truck and immediately began to experience loss of tail rotor effectiveness (LTE), largely due to the complete loss of the tail rotor itself. At this time the pilot determined that the appropriate action would be to initiate an auto rotation once adequate separation between the aircraft and the truck could be achieved. Unfortunately, the current laws of physics did not allow adequate time for the clearance to be achieved, resulting in the main rotor striking the fuel truck and the immediate equal and opposite reaction of the opposing rotor striking the tail section, as predicted by Newton's First, Second, and Third Laws. An unexpected and welcome demonstration of the same principles were noticed when the termination of the main rotor RPM also provided an immediate solution to (LTE). The final observation was made when the planetary gravitational forces exceeded the performance capabilities of the aircraft in its altered state, resulting in an immediate decent to the ground, at which point the remaining energy was displaced throughout the remainder of the aircraft.

Once firmly positioned at the site of the accident located 12.5 statute miles on the 353 radial from (KPIA) (approximately 40' east of where the flight had initiated) and after all of the remaining pieces and parts still attached to the aircraft ceased all momentum, the pilot turned off the fuel supply and master switch, and removed himself from the aircraft. Once it was determined that all of the parties were safe and unharmed, the pilot immediately notified the Peoria County Sheriff's Office and the Jackson, MS Flight Standards District Office to inquire about the appropriate steps and who to contact. The Jackson, MS FSDO informed the pilot that they would initiate the calls to inform that appropriate authorities.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The accident could have been avoided by the pilot visually confirming with his own eyes that all possible connecting hoses were in fact, not connected and the departure could be safely executed.
