Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The right landing gear collapsed, all three propeller blades bent, and the right wing spar was slightly buckled and bent backwards.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On July 27, 2017 at around 10:38 AM local time I departed from the Cochran Airport (48A) in a Rockwell International Walter S-2R Thrush N4886X and proceeded to a block of cotton fields 5 miles SE of the Eastman Airport (EZM) to begin spray operations with 240 gals water/chemicals in the hopper and around 180 gals fuel onboard. After two spray passes I received a call from one of my ground crew at 10:48AM saying that he realized he didn't add enough water to the spray solution which would cause me to run short on the number of acres I was to spray in that load. Since it was closer I proceeded to the Telfair/Wheeler Airport (MQW) in McRae, GA to land and add more water at my satellite loading site located on the SW end of the airport. The wind was around 6kts gusting to 10kts out of the ENE but I elected to land on RW 21 instead of RW 3 since there is a substantial upwards slope from that direction instead of landing downhill with the heavy load in the plane and the fact that my load pad was located on the far SW end as well. I made an approach to RW 21 at a higher than normal airspeed in order to ease it down onto the pavement compensating for the loaded condition of the plane. I touched down around 1,500 ft from the approach end of RW 21. About the time the tailwheel was touching down I hit a depression in the runway pavement that unloaded the weight on the gear and the aircraft veered to the left quickly. I applied full right rudder and brake but with the quartering tailwind weathervaning the aircraft left and the high gross weight landing configuration I couldn't regain control of the aircraft and departed the runway to the left and over an embankment. There were no mechanical problems with the aircraft prior to the accident.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Complacency was the key factor in the cause of the accident. A minimal checklist prior to taxi would have prevented my departing with an insufficient amount of spray solution in the tank which caused to me to make the poor decision of returning to land with a heavily loaded aircraft. Complacency was a factor in my returning to land with a loaded aircraft basing it on thousands of hours of ag flying experience giving me over confidence in my abilities. I should have sprayed the load, returned with a second trip to finish up and compensate the customer for the amount of chemicals I would have run short on which would have been minuscule compared to the cost of the damages that resulted to the aircraft. Complacency also contributed to my choosing an airport with an uneven surface and a runway with a gusty quartering tailwind in order to shorten my turnaround time instead of choosing the smoother surfaced runway at my home base in Cochran and selecting RW 3 with a headwind which would have given me much better control of the aircraft in its loaded condition. I am in the peak of my spraying season and this one bad decision influenced by time pressures has cost me a considerable amount of extra time, work, and financial hardship. Slowing down and basing every aspect of every decision about the job mission from start to end on safety instead of time management will prevent this from happening again.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No
