Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Fuselage tail boom completely broken in several places and mostly disintegrated. Fin and tailplane severed from tail boom. Outer half of right wing completely severed and broken into multiple pieces. Left wingtip spar fractured. Visible damage to fiberglass shell of cockpit. This glider has a small sustainer engine mounted on a retractable boom. The engine will keep the glider aloft but will not self-launch the aircraft. One arm of the propeller was broken and the hardware in the engine bay was damaged.

There was no property damage on the ground other than some broken brush and cactus.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I was competing in the 18 meter National Soaring Championships at Garner Field Airport, Uvalde, TX. The date was August 2, 2017. I was the last glider in the field to launch that day, at about 1:25 PM CDT. The racing task of the day was first to fly west to Bracketville, then to other turnpoints of each pilot's choosing and finally return to Garner field. The racing task was intended to last a minimum of 3.5 hours.

The launch procedure was as follows: Every glider in the field has a separate tow rope laid out by the side of the runway. The tow rope was first connected to the tow plane and then to my glider. The tow plane had a Schweizer tow hook; my glider had a Tost tow hook. My glider had water ballast in the wing tanks to bring it to its maximum gross weight of 1100 pounds.

Takeoff roll and liftoff were normal. Initial climb was established to what I estimated to be 100 to 150 ' AGL. Then the tow rope spontaneously released from the tow plane. I then pulled my rope release handle to drop the rope from my own hook so that it would not remain attached to me. The rope was later found near the end of the runway and was intact.

I felt that I was too low to safely attempt a 180 degree turn to return to the runway. I first tried to descend quickly to land on the grass overrun area beyond the runway, but I had too much airspeed and too little area to land and would have crashed into a solid line of trees at the end of the area.

I pulled up to clear the trees and looked for a better place to land. I entered a gentle right turn to avoid utility wires and trees in front of me. I could see some brushy areas with few trees, mostly sage brush and other shrubs about 4-5 feet tall. This would be a much softer and safer place to land than the wooded tree areas. There were no cleared fields in view, only brush and trees. I kept turning right to avoid more utility wires and found a favorable brushy area to put down in. This was in front of yet another set of utility wires; less than 100 yards in front the place where I landed.

As I was landing in the brush the tip of the right wing struck an isolated mesquite tree, breaking off the outer half of the wing. In the ensuing crash the vertical fin was sheared off and the tail boom disintegrated into several pieces. Additional damage was sustained to the front fuselage, left wing and engine bay.

I believe that the initial contact must have first spun the glider about 180 degrees to the right, then the tail impacted the ground, going backwards. This shattered the rear fuselage and caused the cockpit and attached wing portions to do a complete back flip. I ended up right side up facing the direction from which I had flown. Although damaged, the cockpit remained intact.

I sustained no injuries whatsoever in the crash.

I later activated the tow rope release mechanism to check its status and it functioned normally.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

Although this model glider has a sustainer engine, it is completely unusable at such low altitude. The Pilot Operating Manual recommends activating the engine at 1300' AGL. The engine is a two-stroke engine mounted on a boom which normally is enclosed in the fuselage behind the cockpit. It takes several seconds to extract the engine from the engine bay in the fuselage, and then the aircraft must enter a dive to start the windmill action of the propeller to start the engine. This would, of course, been impossible at my low altitude.

I HEREBY CERTIFY THAT THE ABOVE INFORMATION IS COMPLETE AND ACCURATE TO THE BEST OF MY KNOWLEDGE
