Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Collapsed nose landing gear, propeller tips bent backwards, engine mounts damaged, compass knocked from ceiling

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I arrived at the airport (1G5) and began to preflight the aircraft. This was my first unsupervised solo, having first soloed about two weeks prior and having had one other dual instruction lesson since. Everything on the preflight inspection was normal except for the oil level, which was low (just over 3 quarts), so I walked back to the FBO, asked to get into the hangar to get oil, added a quart to the plane, and then prepared to depart. The wind was about 5kts out of the south, so I was planning on using runway 19 but a Cessna 172 with another student and instructor took off on runway 27 right after I started the engine. They stayed in the traffic pattern so I also taxied to runway 27. The crosswind was not very strong so I was still comfortable using that runway. I took off and flew a standard traffic pattern. I made a normal landing, although I noticed that my airspeed had been a little fast during the approach, and I made a mental note to focus on that for the next circuit. I taxied back and performed another normal takeoff on runway 27, but as I was turning crosswind I heard on the radio that the Cessna 172 was switching to runway 19 for their takeoff. I announced that I would fly a long crosswind leg to avoid crossing their path while they were climbing out and would follow them as number 2 in the pattern. I did that, and set up for a normal approach and landing behind them.

I focused more on my airspeed, and was flying a very stabilized approach with good, steady airspeed. The only thing unusual about the approach was that runway 19 has a 737ft displaced threshold, and I had never landed on that runway before. Regardless, it was still a steady, stabilized approach but I flared a little too high. I recognized this and attempted to correct and let the aircraft settle onto the runway, but when I touched down the aircraft bounced. As it ballooned up and came back down, it bounced again but harder and with an increasing amplitude. It seemed to be happening in slow-motion, and at the time I recognized what was happening as a pilot-induced-oscillation, but did not remember the correct recovery technique. As the aircraft bounced about four or five times, my control inputs caused it to porpoise and on one of the last two bounces the nose wheel contacted the ground first, causing the damage to the aircraft. The aircraft came to rest on the runway near the far taxiway, and I shut down and secured the engine, got out to assess the damage, and then called the FBO on my cell phone to let them know what happened and to ask for help.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The one correction that I did not think of until right after the accident was over was to apply full power and go around. I think that that that did not occur to me at the time because I was subconsciously thinking that go-arounds are executed on approach, and since my wheels had already touched down I was committed to landing. Immediately afterwards I realized that this is not true and after the first or second bounce I should have applied full throttle and gone around for another approach and landing.
