Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

At impact with the soft earth, the engine stopped. Prop at idle speed bent proximate a 3rd of the way from its tips about 10 degrees. The right main gear sheered at the wing lower surface. Approximately 45 minutes later without additional aid for extinguishing, oil fire consumed the canopy/cockpit down to the belly and part of the left wing structure and the entire fabric coverings of the entire aircraft.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On the 12th of October 2017, to plan an A/C range appropriate personal flight, I selected 4A4 with single runway of more than 4000' by 75' for a landing and return to home base of KSRB.

All weather reporting agencies showed relatively cloud free day with relatively calm winds aloft and calm at surface. I also chose KRMG as my alternate in the case of any and all prohibiting issues to land at 4A4. I left KSRB at approximately 11am Central time towards 4A4.

N323WG is a VFR air craft, and I carried current paper chart of Atlanta sectional as required and Garmin 496 as Navigation source.

The Flight operation was to be conducted as an unfilled VFR at 2500 feet MSL with appropriate changes to surpass minimum separation altitudes through Chattanooga airspace. By studying the chart days in advance, I noticed parachute activity in the vicinity of 4A4. Upon arriving within 10 NM of 4A4, I began listening to its Unicom 122.8. I also made appropriate calls to indicate my intention of landing there with full stop. By Listening to the AWOS KVPC1 and runway in use by the existing traffic, it was apparent that runway 1 was in use and winds at surface are calm.

I was intensely listening to ongoing traffic of a De Haviland Otter and a Cessna Caravan which apparently were being used to transport parachuter to drop zones. I also communicated with one of the 2 pilots of either A/C while he was making calls in his flight to get a better grasp of their intervals of take off and landing. It was apparent that as one was making drop, the otter was returning to base 4A4 to pick up more parachuters. My challenge was to insure I worked myself into the traffic pattern traffic for a safe landing within their traffic and the visual approach.

I chose to turn right parallel, opposite direction from runway 1, maintain pattern altitude approximately one half mile north of the airport until the twin otter in take off had left the runway and past pattern altitude; making his left crosswind call before I made a u turn and made a long final for landing. This plan worked as expected for accurate timing. I approached runway 1 perfectly, with plans to land on the 2 mains "2 wheel landing". I was trained that Chipmunks are much more accustomed to 2 wheel landing on pavement, and in my practices and training, this proved to be the safest. Run way was a little more than 4000', far more than needed for this A/C to make safe landings and take off. After a very smooth final and landing, I allowed the chipmunk to 2 wheel until it was slowed down and there was no more air speed on the horizontal elevator to keep it in the air. This also worked well and gave me the confidence that all was well

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

To the best my knowledge as a PIC of N323WG at the time of this accident.

- 1, weather conditions of the day was clear and calm with relatively warm temperatures.
- 2, The Chipmunk landed after twin turbo otter take off
- 3, It rolled about about a third of the runway before tail wheel was grounded at idle speed.
- 4, Sudden uplift of right wing and turn to left as angle of attack increased by #3.
- 5, It is likely that the wind voracities from the Otter still lingered on the runway causing the up lift.
- 6, Chipmunk is a light A/C with large wing surface.
- 7, Cross wind component maximum is 15 Knts.
- 8, For my personal limits I sat it at 10 Knts.
- 9, Distance to land behind another A/C must be increased. Not sure as to motive at this time.
