NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On the afternoon of October 15, 2017, I, along with my CFI, was involved in an incident.

It was an instructional flight, that took us from our home base airport (s36) to the practice area, and then to Auburn Municipal Airport, to practice some landing maneuvers.

We had just carried out a landing, and we were in the pattern setting up for a power-off 180.

At about midfield, I carried out the landing checklist: fuel on both tanks, cowl flaps closed, carb heat, prop high and mixture rich. I then proceeded to lower the landing gear lowering the handle to the down position. Immediately after position the handle in the down position I heard a soft noise of the hydraulic motor actuating. A few instants later I glanced at the indicator light, which I believe was green-lit.

I also heard no warning horn. As we approached the abeam the numbers position, I lowered the flaps and began the maneuver. We had a sterile cockpit, with no side conversations, besides the one necessary for a safe landing. As I approached the turn from base to final, I made sure again that the handle was down, placing my hand on it, and feeling that it was fully down I placed it back to the throttle. Note that I have never visually verified the position of the landing gear by looking outside the windows. As we overflew the numbers at a few feet I had a spare second where I felt something was off and right the airplane landed on the nose wheel and on the tail. After a second of uncertainty, I proceeded to secure the engine by pulling the mixture and turning off master and ignition. I took my feet off the pedals to avoid off balancing the aircraft, and tried as much as possible to keep the wings level and again I verified that the gear handle was down. We both did. The airplane slowed down rapidly, finally coming to a stop about halfway down the runway. Since the left main gear was outside of its housing, the airplane banked right, and came to rest with the right wing on the ground. I made a radio call to the CTAF advising of an aircraft disabled on the runway, and we proceeded to evacuate the aircraft, from my door. We got to a safe distance from the airplane and I walked around it to verify any fuel leaks. My CFI got on the phone right away to call the police, FAA and NTSB.

The aircraft hit the ground at around 14:20 local.

We were approached by a few men, one of which stated to be working near the threshold of the runway which we hit. He stated that he had seen us coming in to land with the mains "flapping" (therefore partially extracted) and the nose gear down and locked.

One of the guys, my CFI was on the phone with, asked us to check whether the circuit breaker popped. We both approached the aircraft and verified that the hydraulic motor circuit breaker was in fact popped. I do not know when it popped.

Our mechanic drove to the airport, and met us on the runway where the aircraft was lifted, landing gear was extended by hand, and the aircraft towed to a parking spot on the ramp.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Increase emphasis on procedures and checklist usage.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

The landing gear motor circuit breaker opened for unknown reason.

On October 15, 2017 I was providing flight instruction to Mr. Alessandro Fabrizi in a Cessna 172RG owned and operated by Crest Airpark, Inc. Mr. Fabrizi is a private pilot with an instrument rating and is training under FAR 141 for a commercial pilot certificate. We departed Crest Airpark around 1430, and proceeded to the southeast practice area. We flew several commercial flight maneuvers, and then proceeded to the Auburn Municipal Airport for touch and go takeoffs and landings. The first touch and go was a soft field landing with a soft field takeoff. The pattern was clear of traffic, and I advised Mr. Fabrizi to make a power-off 180 landing (a commercial flight test maneuver), as there were other aircraft approaching the traffic pattern from the west. He retarded the throttle to idle opposite the end of the runway and put the gear down. My normal routine is to observe the student put the gear down until the gear down light illuminates. I did not do so this time. Mr. Fabrizi turned base and extended flaps 10 degrees. I was focused on the approach and he appeared low, so I coached him to turn final early, "point at the touch-down point", and I continued to focus on his approach. My normal routine is to do a "final" check at about 200 feet AGL, checking that the approach is stabilized, gear is down, and cleared to land and/or runway clear. I did not do so, and I don't recall if the student performed a "landing" checklist, either a flow pattern, or using the checklist. I believe he did not. The landing flair was fairly "flat" in order to reduce floating. When the aircraft slid to a stop, I observed that the landing gear handle was in the down position, but the gear down green light was not illuminated. Mr. Fabrizi shut down the engine and completed the after landing checklist. We exited the airplane through the left door as the right wingtip was resting on the ground. The nose gear was extended, while both main gear were resting on the ground. They were not up and locked. While speaking on the telephone to the NTSB investigator, he asked the status of the landing gear circuit breakers. We checked and noted that the landing gear motor circuit breaker was open. I have no idea when or why the circuit opened. The aircraft was lifted using a strap. The main gear was extended by hand, and it locked into the down position. The airplane was then towed to the ramp.
