Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The prop struck the ground with one blade tip, bending the blade tip aft. The aircraft's nose landing gear was bent up and aft of normal mounting position. This bent the fire wall as well as outer aircraft skin underneath the cockpit forward of the main landing gear. The cockpit floor was bent and miss formed just aft of the rudder pedals. The center pedestal was bent and deformed at the floor. This produced binding of the pitch and roll controls from the yoke. The tail struck the ground removing the tail tie down ring and scraping the bottom of the empennage and rudder.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Student pilot on first solo landing flight.

Taxi - had no issues during taxi.

1020 takeoff #1 - normal. No issues. Wind calm runway 27L

1024 Landing #1 - Called tower midfield. No preceding traffic. Cleared to land. Turned a little soon, so he pulled out extra power to make up for it. Came in with full flaps with final approach speed of 68 kts. Normal landing, touched down between taxiway D and threshold.

1030 Landing #2 - Called tower midfield. One preceding aircraft on final. Cleared to land #2. Hesitant to descent fully until the preceding traffic was clear. Found himself approximately 1300 ft. MSL (400 AGL) crossing the threshold of 27L. Decided to go around.

1035 Landing #3 - called tower midfield. Does not remember any preceding traffic. On glideslope for final, but was about 10 kts fast. forgot to lower the third notch of flaps. Touched down just past taxiway D. Thinks he landed flat. Bounced, and was startled during the bounce. Second bounce came down more nose down. Heard a thump. Went full power and performed a go-around. On takeoff, stall horn went off. Lowered the nose and raised the flaps one notch at a time. Yoke seemed further aft than expected. Told tower of go-around. Aircraft had normal climb characteristics.

1040 Landing #4 - called tower midfield. No preceding traffic. Requested full stop landing. Cleared to land. Started base turn over the railroad tracks. Did a no-flap landing. Final approach speed of 76 kts. Landing was normal. No bounce. Touched down between taxiways D and C. Cleared off on runway 23 by tower and taxied back.

Return taxi - no issues.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Student pilot seemed to be unfamiliar with techniques to recover from a bounced landing. The student should receive more training to ensure that student could recognize and recover from the attitudes and airspeeds that result from bounced landings. This accident could have been prevented if the student had recovered and executed a go-around after the first bounce.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

Damage to aircraft was as result of the bounced landing and is described above.
