NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I am a student pilot who uses a cross country endorsement to fly from KBCk to KLSE and back. My lessons are based out of KLSE, while the airplane is hangared at KBCk. On the date of the accident I had flown from KBCk, completed my lesson and was flying back. Shortly after leaving KLSE airspace I switch one of the radios over to KBCk and begin listening to AWOS. Due to the short trip over I normally stay around 2500-3000'. On this day I had hit some turbulence so I climbed a bit higher (3500-4000') before it cleared up. The trip is short enough (30 miles) that by the time I complete my cruise checklist and listen to AWOS a couple of times on my way in I am descending. I remember seeing groundspeeds of 150-153 knots on the GTN650 and a very fast trip. Wind had been called 6-10 knots from approximately 110 degrees at KBCk for most of the trip. Normally I use runway 26 due to predominantly western winds. On this date I chose to use a straight in approach to 8 due to the southwestern winds. As I descended I again had turbulence from approximately 3500' down to approximately 2500'. By the time I arrived at pattern altitude of 1800' the turbulence had smoothed out and I was lined up on the extended centerline. During the descent and as I lined up for the approach I listened to AWOS again and heard "Winds variable between 110 and 160," which I had never heard before. I was crabbed to the right (south) significantly as I descended, but was able to descend on glideslope with no issues. My IAS was approximately 75kts with 20 degrees of flaps. As I straightened by crab angle out on centerline I was quickly pushed left (north) of center. My northernmost wheel was still lined up on asphalt, but I did not want to be pushed into the grass on touchdown. I estimate I was 5-15' off the runway when I made this decision. I had added full power and leveled off my descent in an attempt to go around. The plane was beginning to accelerate and I came to level and began to slowly climb. I estimate that I was 30'-50' off the ground when I believe a gust of wind caused me to bank/turn left, resulting in the crash.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

To prevent the crash I should have stayed in ground effect until more airspeed was developed while slipping to the right to avoid the crosswind effects. I should have then attempted to climb. Additional crosswind time with an instructor is warranted.

Additionally I believe that AWOS at KBCK should be examined to ensure accuracy. I believe that I was unknowingly exceeding the crosswind limits of that aircraft (C182). I routinely assume that it is underreporting windspeed. After the accident, as I have on other days, I noted that the sock was fully level while AWOS was reporting less than 10 knots. While on the ground after the accident I noted several significant gusts that are not reflected in the historical data graph.
