NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I LOOKED BUT DID NOT SEE! Don't let expectation bias bring on the unexpected!

Both tanks were filled to within about 1.0" (LH) and about 1.5" (RH) of the top (about 22 gallons and 20 gallons, respectively, on Sunday, 11/5. Both wet wings exhibit slight seeps at the very top when topped off.

After engine start, the EDM700 (whose fuel-flow transducer (K factor) is properly calibrated per JPI's instructions) Fuel Quantity was updated with my standard conservative 43 gallons, as I never use 50 gallons, the M20E total usable fuel, even for instances when line personnel "top" the aircraft contrary to my instructions. Only when departing promptly on a cross-country trip do I fill both tanks completely, and then still update the EDM 700 with 43 gallons. It will then provide low-fuel alerts well in advance.

I planned to make three touch-and-gos (about 0.2 hrs), as I had about once per week for the 15 years that I had been operating this aircraft. This year had been an exceptionally busy one for me, until early November, allowing very little time to fly.

The prior flights, since fueling:

Note: the EI digital tach records time when RPM is above 1200.

1. three touch-and-gos on 11/5, for 0.2 hr (RH tank)
2. three touch-and-gos on 11/12 for 0.2 hr (RH tank)
3. three touch-and-gos on 11/19 for 0.1 hr (RH tank)
4. GAMI Lean Test 15 NM west of KRYN on 11/23 for 0.7 (LH tank)

The accident flight on 11/26 was, again, to be three touch-and-gos (RH tank).

As I ALWAYS do, I sumped the RH tank, removed the RH filler cap, visually confirmed fuel present at the expected level, and returned the (uncontaminated) contents of the fuel sample container to the tank. Although I had a calibrated dip-stick, my practice had always been to use it when the fuel level appeared to be under 10 gallons.

Life was good! It was a beautiful day; I was ready; 02Q was ready; we would be back in the parking spot in a "jiffy." Well, not so fast!

During initial climb (RWY 33), at about the crosswind-turn point (600' AGL), the engine surged once or twice and quit. My immediate thought, other than "oh no," was "don't stall this airplane!"

Immediate-action items: ignition, mixture, throttle, aux pump, were all as expected, as the power interruption occurred during full-power climb. Furthermore, fuel selector position was as expected, on the RH tank. "As expected," in this case was not what was needed, of course, that realization costing precious seconds to reach.

My first control input should have been to initiate a turn to the right, which would have put me quickly over the airport property, in position to land with little or no damage. I was NOT thinking of attempting a turn to any runway, although it probably would have worked. My conditioning acquired during many touch-and-gos led me to turn left and back south toward the airport boundary, all the while being mindful not to increase the AOA. I then had the chance to breathe and switch to the LH tank (at about 300' AGL). I know I repeated out loud, "Don't stall this airplane!", and recalled Bob Hoover's caveat to "fly into the crash for as long as possible."

The tops of the mesquite trees then snagged the gear, and the rest was a blur...at some point power had come back. I cannot guess with any confidence at how long the delay had been after switching tanks, but it was probably about three seconds. While airborne, power restoration would have been obvious, since the throttle was wide open.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

My first control input should have been to initiate a turn to the right, which would have put me quickly over the airport property, in position to land with little or no damage. I was NOT thinking of attempting a turn to any runway, although it probably would have worked. My conditioning acquired during many touch-and-gos led me to turn left and back south toward the airport boundary, all the while being mindful not to increase the AOA. I then had the chance to breathe and switch to the LH tank (at about 300' AGL). I know I repeated out loud, "Don't stall this airplane!", and recalled Bob Hoover's caveat to "fly into the crash for as long as possible."

Lessons:

1. Make the SHORTEST turn TOWARD the airport, traffic conditions permitting; traffic conflicts are very rarely the case at KRYN (the short turn to the airport is something that I had not been considering during those 15 years of similar pattern work).
2. Switch tanks IMMEDIATELY, while being mindful of AOA. We should be able to do two things at once (or three, including that ball-in-the-middle careful turn).
3. Unless that tank is clearly FULL, STICK it!!

Items 1 and 2, as well as great cost (emotional, self-esteem and financial), would have been obviated by accomplishing item 3!
