Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Engine, propeller, cowling, left main landing gear strut, rudder, left wingtip, right wingtip, and canopy damaged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Took off and remained in the landing pattern for KPVG runway 10 for crosswind landing practice. Wind was reported as 180 at 10 knots with occasional small gusts by AWOS. Takeoff and first landing (wheel landing, partial flaps, touch-and-go) were uneventful. Subsequent incident landing was three-point with full flaps to a planned stop-and-go. Landing checklist was accomplished on downwind. Approach was normal, with significant right-to-left crosswind above 400 ft AGL. Crosswind diminished approaching the runway. Aircraft was on-centerline, on-target-airspeed of 70 KIAS at desired height and rate-of-descent crossing the approach end of the runway. Crabbing crosswind correction was changed to wing-down, top-rudder approaching the flare. A good touchdown occurred on centerline with no lateral drift about 700 ft from the approach end, initially on the right wheel and tailwheel (in accordance with the wing-down, top rudder method) followed by the left wheel. Almost immediately, the aircraft heading began to diverge to the right (into the wind). I applied full left rudder and maintained aft stick but detected no decrease in the divergence from the rudder input. I attempted to apply left brake which was ineffective. Finally, I applied a short burst of throttle to improve rudder effectiveness, which arrested most of the divergence. However, by this point the aircraft was exiting the side of the runway so I reduced power back to idle. The aircraft rolled relatively straight onto the grassy area adjacent to the runway, whereupon, in spite of aft stick, the nose of the aircraft fell through and dug into the turf. The aircraft overturned completely, coming to rest on the cowling and cockpit roll bar. I had landed with the canopy 80 percent open, where it remained. With no sign of fire or leaking fuel I exited the aircraft in deliberate fashion, although I was initially restrained by the seat-pack parachute; the shoulder straps would not allow me to squeeze through the opening in the canopy, so I had to completely remove the parachute before I could successfully exit.

Damage to the aircraft included bent propeller, displaced engine, bent left main landing gear strut, crushed canopy frame, minor scraping on left wing tip, scraping and bent leading edge of right wing tip, and bent rudder. Curiously, with the aircraft at rest inverted, the tailwheel was not locked and was swiveling freely, although from the position of the control stick, it should have been locked automatically.

The aircraft was subsequently righted by cranes and towed to the hangar.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The T-6 requires continuous, laser-concentration to directional control throughout the landing.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

While the tailwheel was unlocked after the event, post-flight inspection shows proper operation of the tailwheel lock. Whether the tailwheel lock malfunctioned on landing or was disengaged by the event is undetermined. The rear seat parachute was resting near rear cockpit rudder pedals after the event, and could have interfered with the rudder pedals. It was verified to be well-secured during preflight, so movement was probably caused by the event. A small flashlight was found resting against the front control stick forward elevator pulley, wedged against the brake module. While its position prior to the event is not known (its current position easily seen from the pilot seat), it could have interfered with the flight controls. However, no interference was detected during the event.
