Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft nosewheel suffered a flat tire, bent fork and cracked wheel casting when struck by the front edge of the roof of a passing car about 5' AGL. After the aircraft came to rest, the tip of a rotorblade was struck by the exhaust stack of a passing semi truck, producing a bend in that blade near the root.

The car which struck the nosewheel had a cracked windshield and a dent in the roof, repaired at a cost to the pilot of \$1,813.16. Damage to the semi included a bent exhaust stack (pipe), several other minor dents and scratches to the tractor, and a cracked fiberglass panel on the trailer, repaired at a cost to the pilot of \$8,345.17.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On the day of the incident, I was undertaking a cross-country, VFR flight which was intended to satisfy the solo requirement described in Part 61.109(d)(4)(ii). I chose Nephi (U14), Delta (DTA) and Manti-Ephraim (41U) as the three required landing points. I used weather.com and all three AWOS phone links to check forecasts and monitor weather for several days before the flight. In the weeks preceding the flight, I made evaluation flights in the aircraft totalling 9.9 hours, including two round-trip cross-country flights between U14 and U77, to verify fuel burn and performance. I mapped the route on an electronic sectional chart image, estimated the additional distance needed for terrain avoidance, and decided to make the flight on Thursday, December 7.

In the days leading up to the flight, a high-pressure weather system developed over the area. Monitoring the AWOS stations each morning, I observed reported dew point spreads as low as 1°C after dawn. I adjusted my plan accordingly to start the trip in late morning. On the day of the flight, my departure was delayed by factors including conversations with unexpected visitors at the hangar and programming new radio memories. Engine start for the first leg was 12:45pm MST.

The first two legs of the trip went very close to estimated flight times, fuel burn was as estimated, and winds reported on AWOS at Nephi and Delta varied from north to west, between calm and 6 knots. I left Nephi with 14 gallons of fuel, and topped off at Delta with 5.4 gallons. My departure from Delta was delayed by conversation with a curious bystander and difficulty accessing self-serve fuel. When I arrived at Manti-Ephraim, I transferred all aux fuel into the main tank, and used the rest room. My estimate for the 32 nm flight home to Nephi was 36 minutes and 2.5 gallons of fuel at my 54 knot cruise speed. I considered taking on full fuel, but the delay would have required aborting the flight and abandoning the aircraft overnight. I departed at approximately 16:40 MST with just over 6.5 gallons of fuel.

As I flew north past Ephraim, I failed to recognize a critical landmark, UT Highway 132, which turns west and descends through the only available pass back to Nephi. I believed if I continued north along the east side of the hills visible to my left, I would spot the pass, but I had already passed it. By the time I realized I had missed the checkpoint, daylight was disappearing. Unaware of where wires might cross the rural highways nearby, I concluded my most survivable option with remaining fuel was to follow US 89 to its merge with US 6, then follow the road down Spanish Fork Canyon to U77, an airport at which I had recent cross-country experience. Based on a recollection that Spanish Fork was 26 nm north of Nephi, I estimated my ground track would total about 60 miles, likely within range of fuel onboard.

Fuel exhaustion occurred just before I exited the mouth of the canyon, with Runway 30 at U77 in sight. I gained speed to match highway traffic, picked a large gap between vehicles, turned on the landing light, and prepared to land on the westbound lanes. I had hoped the nav and strobe lights would alert overtaking vehicles, but as I slowed to flare, a car gaining on me from behind struck my nosewheel. This caused the nose of the aircraft to rise suddenly, but I was able to complete a successful landing, and the aircraft came to a stop on the right shoulder of the road. The aircraft and the automobile which struck it both sustained minor damage, and there were no injuries.

Post-Flight

Once the aircraft came to rest on the shoulder, I latched the rotor brake in the on position and held the cyclic full right to maximize clearance to passing vehicles. Just after the rotor stopped, a passing semi truck struck one rotorblade near the tip with its exhaust stack, causing deformation of the blade near its root, and minor damage to the truck. There were no injuries.

The first people to approach the aircraft after the incident were the driver and passenger of the car which hit the nosewheel. After we confirmed we were all uninjured, I called a friend at Nephi to advise him of the off-airport landing, then called 911. The driver of the semi truck which contacted the rotor blade then reached the aircraft on foot, and confirmed he was also uninjured. All involved parties and vehicles were cleared by responders to leave the scene after a police report was completed and the FAA and NTSB had been contacted.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Any of the following could have prevented this off-airport landing:

(1) More formal flight planning, including estimated time to the top of the canyon leading to Nephi, would likely have prevented the missed checkpoint. I relied instead on spotting landmarks which looked dramatic on the sectional chart, but which turned out to be much less obvious from the air.

(2) Earlier departure on the last leg would have allowed a better chance of spotting the entrance to the canyon, Utah State Road 132, and the city of Fountain Green.

(3) Even if the above two steps were not enough to successfully stay on course, filling the main fuel tank to its capacity of 9 gallons before departing on the last leg would have allowed reaching Runway 30 at Spanish Fork with legal fuel reserves, as opposed to a forced landing less than six miles short of the runway.

A chain of contributing factors started with a late departure from Nephi and additional delays at Delta. GPS navigation, while it would have disqualified the flight from satisfying Part 61.109(d)(4)(ii), would likely have allowed recognition of my missed checkpoint. A mobile phone with Avare moving-map software was in my coat pocket as a precaution, but I found it could not be accessed and operated in-flight without risking loss of aircraft control.

On page 3, engine date of manufacture is listed as "unknown." The Rotax Model 99 582 DCDI is not a certified aircraft engine, and a date of manufacture was not found in aircraft records.

Clarifying information on page 5, the pilot does not hold a gyroplane rating, but does hold a Sport Gyroplane endorsement. N395SC qualifies as a Light Sport Aircraft as defined in 14 CFR 1.1.

On page 8, weather information is incomplete due to lack of historical ATIS data from Provo (KPVU), the reporting station nearest the landing point.
