NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On November 30, 2017, at approximately 4:10p.m. EST, I operated a return flight under visual flight rules (VFR) from the Ocean City airport (KOXB) to the Freeway Airport (KW00) located in Bowie, Maryland, pursuant to Title 14 of the Code of Federal Regulations (C.F.R.) Part 91. Prior to departure, I filed a flight plan for a flight within the Washington, D.C. Special Flight Rules Area (SFRA). I performed a preflight inspection of the aircraft, a Cessna C-172, FAA registration number N474SP, checked the weather on Foreflight via my iPad, and noted that official sunset would be at 4:47p.m. EST. Before taxi, I turned on the instrument panel lights, the aircraft position lights, rotating beacon and anti-collision strobe light. During flight and prior to entering the Washington, D.C. SFRA, I contacted the Potomac Terminal Radar Approach Control (TRACON) to activate my previously filed SFRA flight plan and was issued a transponder code. At approximately 5:20p.m. EST, I notified the Potomac TRACON that I had Freeway airport in sight. After receiving instructions from the Potomac TRACON controller to monitor the Freeway Unicom frequency and keep the SFRA transponder code until on the ground, I contacted Freeway Unicom for an airport advisory. At that time, Runway 18 was in use with light winds from 180 degrees.

After an initial approach to runway 36, which terminated by execution of a go-around, I re-entered the traffic pattern altitude and headed downwind for Runway 36. I announced on the Unicom frequency that I was "downwind for 36" to "Freeway Traffic." At that moment, the Freeway Unicom operator recommended Runway 18. I immediately executed a 180 degree turn to the left from the downwind heading of 180 degrees to a new heading of 360 degrees, turning at a standard rate away from the airport. This 180-degree turn increased my distance from the runway. I announced on the Unicom frequency that I was "downwind for Runway 18." I partially lowered the flaps, reduced power to 1500 RPM, started a descent, turned 90 degrees to the left and announced the base leg. I saw the runway edge lights as I announced my left turn stating that I was on "base leg for 18". At that point, I identified the electrical power pylons that are located near the airport in a straight line with Runway 18. I announced my turn to "final approach for Runway 18." On final approach, I checked my air speed, lowered the flaps, and checked the correct glide path. I aligned the aircraft with the runway edge lights, but I was still too far away from the runway threshold to see the 2-light PAPI lights located to the right side of the runway threshold. I was taking care not to overfly the electric pylons to my right and maintain a safe altitude over the car and truck traffic on U.S. Route 50. A cloud bank to the west of the airport meant that the official sunset at 4:47 p.m. EST was not followed by the normal one hour of "civil twilight" when the sun slowly descends below the horizon. Rather, because of this cloud bank, it become completely dark more quickly. The aircraft was equipped with a new Garmin G5 Electronic Flight Instrument. I noted that the airspeed display differed from the old airspeed indicator mounted a few inches to the left of the much brighter G5 instrument. The altimeter tape read out on the G5 also differed from the old altimeter gauge mounted to its right. Before looking down at the instrument panel, as I turned onto the final approach, I aligned the airplane midway between the two rows of runway edge lights and maintained a stabilized approach. My judgment of altitude was affected by the scarcity of observable objects in the landing area, the "black hole" effect, which was likely worsened by the brightness of the instrument panel's G5 and Garmin GTN 750 fully integrated GPS/NAV/COM/MFD. Three days earlier, on November 27, I received two hours of ground instruction and 0.9 hours of dual flight instruction with a certified flight instructor to familiarize myself with the newly installed Garmin equipment. However, the familiarization flight and dual instruction was conducted during daylight hours. After turning to final approach, I saw the runway edge lights clearly. My intention was to maintain the recommended airspeed of 60 knots on final approach and to execute the approach and landing in the same manner as I would during the day. However, when I looked up from the instrument panel, I first saw the branches of small trees in the windshield. After the airplane nose sank below the horizon and the aircraft turned upside down, I knew that the main challenge was to exit the aircraft. I was upside down, suspended in my seat belt, in the dark, with limited light provided only by the flashing strobe light on the tail and the instrument panel lights. When the aircraft finally came to a rest, I unfastened my seat belt, rotated to a horizontal position and pushed on the partially open window to exit quickly. Prior to impact, I did not experience a loss of power or aircraft equipment malfunction.
