Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)***Damage to aircraft:**

Damage was caused primarily by impact with airport perimeter fence. Left and right wings had substantial damage and wing disfigurement. Propeller damage. Nose gear damage. Windscreen damage. Horizontal stabilizer damage.

Damage to property:

Damage caused to airport fence due to impact with airplane. Damage cause to airport grass due to airplane rolling through grass.

Damage to airport lighting (1).

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Preflight was normal. Used checklist. Fuel indicator was set to "both" for entirety of flight.

Engine run up was normal. Before takeoff checklist was completed successfully.

Take off was roughly 1400 pacific time with southbound VFR departure requested. Departed on runway 16R. Completed climb checklist.

Airplane was flown initially following the Pudget Sound coast southbound at 1500-1600 ft.

Airplane then changed course cutting between and over Magnolia and Queen Anne hills. The airplane then flew southbound west of the city of Seattle. Just south and even with Century Link Field and Safeco Field, the airplane cut East. Over the lake Washington Coast, the airplane turned north. Noticing slight potential signs of carb icing, the pilot turned on carb heat when crossing over the 520 bridge. The airplane then turned northeast. After approximately 7 minutes of carb heat, the pilot turned off carb heat and noticed a return to normal operation. The airplane then climbed to 2500 ft and proceeded towards Monroe. Over Monroe, the airplane climbed to 3000 ft, turned east and then north once the mountains 2 miles away. The plot then turned west, and flew towards Silver Lake.

En route to Silver Lake, ATIS information was gathered and the landing checklist was completed. The pilot initiated contact with the Paine Field Tower east requesting touch and go's. The pilot was cleared for straight in flight and to expect runway 16L. The pilot was requested to advise on 2 mile final. The pilot proceeded direct to runway 16L. The pilot started descent and turned on carb heat. The pilot went through the landing checklist again. ATC advised of traffic. The pilot looked for traffic. The pilot requested runway 16R and received no answer from ATC. The pilot advised the tower of 2 mile final for runway 16L. The pilot was advised of traffic on the runway with a quick departure and was asked to confirm touch and gos. The pilot acknowledged the traffic and confirmed the request for touch and gos. The pilot was cleared for the option. The pilot touched down with 35 degrees flaps, at 65-70 knots. The pilot immediately retracted the flaps, turned off carb heat and moved the throttle to full. The pilot checked engine gages, all looked normal. At rotate speed the pilot pulled back on the yoke to take off. The airplane is in ground effect. There is approximately 1/2 of the runway left. The pilot immediately notices a lack of climb rate being registered on the Vertical Speed Indicator and a lack of airspeed increase on the airspeed indicator. The airplane is at 60-65 knots indicated. The pilot then lowered angle of attack in order to build up airspeed as a pilot would in a short field takeoff. The airspeed did not increase. The pilot again tried to gain altitude by pulling back on the yoke. No vertical climb rate or climb was perceived or indicated. The pilot lowered the nose again to build speed. No increase in airspeed was perceived. The pilot aware of the lack of runway left and trees fast approaching decided one last time to raise the nose to try and initiate a climb out of ground effect. The pilot pulled back the yoke and again no positive rate of climb was perceived. The pilot decided to abort the takeoff. The pilot closed the throttle and attempted to slow the aircraft down with a high angle of attack and no power. The pilot the attempted to force the aircraft down to the ground by lowering the nose. In doing so the aircraft ballooned. The airplane landed on the runway. The pilot had breaks fully compressed. The airplane experienced runway excursion and rolled into the grass. The pilot still had breaks fully compressed. The pilot was applying back pressure to take pressure off the front nose gear. The airplane struck a fence and came to a rest shortly afterwards. The pilot's head struck the visor of the airplane where he received an extremely minor cut. The pilot asked the passenger whether he was okay or not. When he responded yes, the pilot told him to get out of the airplane as fast as possible as the pilot was concerned about a potential fuel fire (did not take place). The passenger and the pilot exited through their respective doors and ran approximately 30 feet away from the airplane.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The pilot could have aborted the take off earlier - preferably immediately after first non-positive rate of climb was observed.

The pilot could have not attempted a touch and go and rolled to a full stop.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
