Saturday December 9th, 2017

This was my second flight in N750AD, the very first test flight of this airplane was on 12/03/2017 of 25 minutes duration with no issues. The 12/9/2017 flight was intended to be a test flight to investigate the slow speed flight charactersitics of N750AD at altitude. I was operating under the operating limitations of my special airworthiness certificate for phase 1 testing.

I taxied from my hanger to runway 21 and checked wind conditions on local AWOS while taxing to Runway 21, which was reported to be 230 degrees at 7 kt. This was consistent with the AWOS reports that I had checked several times by phone that morning before deciding to fly. The wind sock showed the winds to be from the south, agreeing with the 230 degree wind direction report.

I stopped short of runway 21 to perform engine run up and mag checks, radio check, etc. Ran through my checklist twice and announced my intention to depart on 21.

I lined up the centerline of runway 21, advanced full throttle and began my takeoff run. The takeoff run was very short before rotation and I began a climb at a fairly steep angle (unintended), consistent with the capabilities of this STOL aircraft with fixed leading edge slats and the 130 HP engine. Having never before performed a steep STOL takeoff, I was a bit surprised but expected the airplane to be capable of continuing the climb. However, I began a turn to the left, probably at 30 degrees off the runway centerline. My expectation was that I could continue to climb out and then realign with the runway centerline. However I nosed down while turning slightly to the right and contacted the turf adjacent to runway 21 with my nose gear first, then RH main gear, and RH wingtip.

I was not injured during the contact with the ground, I shut down the master switches, exited the airplane and began to check the airplane for damage. Given that the nosewheel/fork was no longer attached to the strut it was obvious that this very short flight was over. After a few minutes the ground staff from the Venango Regional Airport arrived to assist, along with a few transitioning pilots who had been eating lunch in the airport restaurant.

At that point in conversation with the other transitioning pilots I was trying to figure out what had happened. We noted that the winds now were now gusting at what they estimated to be 10 to 12 kt, with the wind sock showing them to to be about 90 degrees to runway 21 approximately from the West.

Monday morning quarterbacking says:

1. I had held too much aft stick during take off roll, I was just getting familiar with the aircraft and the "normal" stick position.
2. Because of the aft stick position, I rotated too quickly at too slow of an airspeed. Then perhaps affected by a crosswind gust and/or engine torque effect the airplane intitated a fairly abrupt LH turn, and I over corrected?
3. Just speculation, as I certainly don't remember doing this, but I may have then pulled back the throttle causing my descent??

With 55 hours flying total expereince, 9 hours in a CH750 STOL aircraft, I was not execting that aggressive of a climb, or from the AWOS reports a crosswind gust. Just getting familiar with this particular airplance, which has 30% more power (130hp vs. 100hp) and a lighter takeoff weight that day that the CH 750 I had previously flown with my CFI during transition training.

Thankful that I can learn from that expereince.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Observation of the wind sock just prior to takeoff roll to confirm wind direction and speed.

Concentration on maintaining a level flight attitude during takeoff until Vr speed is attained.

Additional transition training in the CH750 STOL to include steep climbs during takeoff.
