Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft flipped over with wing, fuselage and propeller damage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On the flight to KSOW we only experienced one or two minor areas of light turbulence. We had already collected weather prior to take off and we also listened to the the AWOS about 15 miles out from the airport. The AWOS was consistent with what was briefed in our weather. We were expecting a 10-15 kt headwind and a 10-12 kt crosswind as we saw in foreflight. The purpose of the lesson was to teach my student crosswind landings at high density altitude airports, because he intends to move near Showlow and buy an airplane upon completion of his private pilot rating.

My student was not flying the approach with my desired precision and because of this I took the flight controls at about 500-700 AGL. We were then able to maintain a stabilized approach, hold centerline, and verify that we had mostly headwind with what felt like and appeared from the wind sock to be a 10 kt crosswind wind from the right to the left.

Our touchdown was on centerline and both mains were able to touch down at the same time. This was a mellow crosswind because the crosswind was not strong enough to force me to land on the right main and then the left main after slowing down. We were slowing down on both mains and increasing crosswind correction with our ailerons as we began to lose control surface authority due to the slower speed. Our front wheel was still in the air and then our aft end of the airplane was suddenly lifted up as if it had been hit with a much stronger gust than reported and from a different direction than reported. The aft end of the plane was lifted up from the rear right to the front left forcing the front wheel onto the ground and lifting the plane onto the left main leaving the right main in the air. This wind then pushed us further. I applied full left rudder attempting to use the nose wheel to steer us back left since the wind was forcing us off to the right side of the runway. After I realized the full right aileron crosswind correction and left rudder was not improving the situation I relaxed the controls slightly back towards neutral and it did not affect the trajectory of the airplane at all. At this point we were being shoved into the grass/mud next to the runway. I was able to get the right main back down upon leaving the runway and had full aft elevator applied, then the front wheel stuck into the mud and we slowly flipped over onto the nose of the aircraft and eventually completely upside down. We then exited the aircraft as quickly as possible after shutting off the mags and master.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Unfortunately, this accident was caused by an unexpected strong gust of wind, that resulted in runway departure. Overflying the airport rather than relying strictly on automated weather systems would have been a better choice, because the gust of wind would have been felt and the decision to land would have been avoided.
