Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft came to rest inverted in a field beneath a powerline. substantial damage to horizontal stabilizer where impacted power line. Substantial damage to airframe. All three props were bent indicating propeller was turning when struck the ground. Terrain was flat brushy desert. Damage to power line.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Flight began at 6:30 pm departing KGTU to KMDD. Flight began just before sunset, weather along the route was VFR with skies clear. No flight plan was filed. A preflight inspection was performed before departure and a visual inspection of fuel gauges on the wings indicated 22 gallons fuel in left tank and 22 gallons of fuel in the right tank. Flight was planned at 8500 ft MSL, upon reaching 8500 ft MSL cruise, it was determined that winds were creating a substantial headwind. Descended to 5700 MSL where winds were a more acceptable 200 degrees at 60kts. This was as low an altitude as I felt comfortable cruising, which also gave an acceptable groundspeed for fuel usage. Fuel tanks were switched several times throughout the flight so as to keep fuel tanks level. At approximately 8:00 pm, 27 miles from KMDD, I obtained a weather briefing from the automated weather at destination airport. Immediately after, the engine lost a substantial amount of power. I contacted Midland Approach, declared an emergency and requested vectors to the nearest airport. The heading was generally a North to South heading as this gave a headwind. Visibility was very limited as it was very dark and there were no lights around. I saw a vehicle driving down a caliche road that ran on an East to West orientation. It was determined that no airport could be made, and a decision to land on said caliche road was made. This put me on a left base leg to the "runway". Landing gear was extended and one or two notches of flaps were put in. When the airplane was close enough to illuminate the road with the landing lights, I discovered that an electrical transmission line ran parallel to the road on the south side. I banked hard to the left possibly in excess of 70 or 80 degrees of bank. Aircraft struck the power line near the horizontal stabilizer then impacted the ground and came to rest in an inverted position. I removed harness and exited aircraft through the windscreen. It should be noted that at the time of loss of engine power, the fuel gauge for the right tank indicated more fuel than the left tank, and that the fuel flow computer indicated 16 gallons of fuel remained on board. It should also be noted that on the previous flight, which occurred several hours before the accident, I noticed that the fuel gauge for the right tank indicated more fuel than it should have. I made a 60 degree bank to the left and the fuel gauge then returned to its proper indication. Again about 45 minutes later the fuel gauge for the right tank appeared to be stuck, I banked the airplane hard to the left and the fuel gauge again returned to its proper indication. I believe that at the time of the accident the right fuel gauge was stuck, indicating that it had more fuel than it did, and more fuel than the left tank.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Several decisions could have been made to prevent this Accident. Amount of fuel onboard should have more substantial before flight began. A higher cruising altitude would have allowed more time to diagnose the cause of the engine failure, and may have allowed for an emergency landing at a more suitable landing site.
