Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The following components were damaged:

Main rotor blades, mast, tail boom, tail rotor, left skid assembly, windshields, engine: sudden stoppage under power, battery.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On March 10, 2018 at approximately 1400 EST I had completed a pre-flight of helicopter N9020M and performed a normal engine start. Then I listened to the CRG-ATIS for current conditions at CRG. Good VFR wx with SE winds and a comfortable temperature.

After completing the warm-up and pre-takeoff checks I lifted off from the ramp at Craig Air Center located at Craig Municipal Airport KCRG. Then from a hover I contacted CRG tower 132.10 advised them that I had the current ATIS information and requested a departure to the north. I was cleared as requested. I made a normal climb to 500' agl on a northerly track for a planned short VFR local flight. I had not flown the helicopter for some time so I wanted to get comfortable and familiar again. At approximately four to five miles north of CRG I reversed course to return to CRG. I notified CRG tower of this. At approximately three miles north of CRG I decided to make an approach to vacant field along the north bank of the St. Johns river. (The field was grass and appeared to have been recently mowed.) Again I notified CRG tower of my intension. I proceeded to execute a practice auto-rotation to a hover to the middle of this field on a southeasterly heading i.e. into the prevailing wind.

I had a target approach speed of 50 kts

At the bottom of the maneuver (approximately 50' to 100' AGL) with the collective down and the cyclic in the aft position to arrest my forward airspeed I began to reduce the pitch angle on the cyclic. At the same time adding pitch on the collective. It was at this point that I noticed RPM was below the green arc. I immediately tried to add throttle but this induced a large yawing moment and some roll to the left. I applied left pedal to counteract the yaw, but the tail rotor authority was not enough to overcome the yaw at that point and because I was a little late in applying.

The topography was a slightly upslope to my left and my left forward skid contacted the ground.

After this it seemed that I was along for the ride via a dynamic roll-over. The main rotor blades contacted the turf and the aircraft rolled over nose first. From this point the engine was stopped and there was no fire or movement.

I secured the power switches and egressed from the right hand pilot seat. Due to the low airspeed and altitude I was not injured in the roll-over. Not even a scratch or bruise except to my pride.

I confirmed that the battery had broken free from its mount and there was no power on the aircraft.

I did observe fuel leaking from the vent tube on the fuel tank. When the JFRD eventually arrived they plugged the leak with some type of putty.

I immediately tried to contact an FAA representative but being the weekend was not successful even on the mobile numbers that I had stored in my phone. Those I tried to contact include:

Larry Hammerbeck, FSDO 15

Jay Davidson, FSDO 15

Pete Kandravi, FSDO 15

Matt Harper, FSDO 15

When the Jacksonville Sheriffs Department officer arrived he was able to contact William D. Meenan of the FAA and I spoke with him.

I gave Inspector Meenan a verbal report and explained that "botched the auto".

After several hours Inspector Meenan gave clearance to move the aircraft. Florida Aircraft Recovery picked up the aircraft and removed it from the site. It is currently being stored in Hangar B-9 at Craig Air Center, Jacksonville, Florida.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I thought doing an auto-rotation to a hover was a simple maneuver and that I could handle it even though I hadn't flow for a few months. I accidentally over controlled the aircraft while performing this maneuver resulting in contact with the ground.

I am flying approximately four hundred hours per year in fixed wing jet powered aircraft. I maintain currency in three different types. The helicopter flying is a recreational activity. I believe this accident would have been avoided if I had additional recurrent training and proficiency practice.

At one time I owned a H269-A of my own and I was flying it and a Robinson helicopter on daily basis. I built a fair amount of time and was quite proficient in each but those aircraft were sold in the late 1990's. Since that time I have had very little access to any rotor-craft flying. When a friend gave me access to use his H269-A, N9020M I recruited a local helicopter flight instructor and went through a complete check-out with a 61.56(a) sign off at completion. This was almost a year ago in May of 2017. Since then I had only flown the helicopter once more for in October of 2017. At that time I still felt proficient in the aircraft.

Shortly after this event on 3-22-18 I ask for and received dual training from the Chief Pilot of the Jacksonville Sheriffs Department Aviation Unit in a B206 helicopter. We flew 1.4 hours and I practiced: pick up to a hover, set down from a hover, pedal turns, quick stop, hovering in all wind directions, strait in and 180 auto-rotation to a hover, hovering auto, pinnacle landing and landing on a pad.

After doing several auto-rotations with the instructor I again feel confident and recognized the correct sight picture and procedures.
