Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wingtip torn and bent; Left wing damaged at attachment with fuselage; left rear window broken; right stabilizer leading edge crushed; both prop tips bent in ground strike.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On Sunday, March 11, I made arrangements with Mr. Stogsdill to bring my plane to his shop at Ruby Star Airpark (14AZ) around 1 PM the following day. Mr Stogsdill was going to replace the top elevator skin, which had some cosmetic hail damage, as well as repair some cosmetic hail damage to the the top wing surfaces. He was also going to repaint the wing and elevator along with the top skins of the ailerons and flaps, which had been replaced earlier.

Monday morning, I got all the relevant information on 14AZ, and checked the forecast weather from the National Weather Service. The forecast was favorable. I drove to and had lunch with my mechanic at the Ryan Airport Cafe at noon. I did my usual pre-flight which included: removing tie down chains, cowl plugs and rudder lock; checking tires, control surfaces, drawing fuel samples and visually checking fuel quantity (9 gallons usable in each tank). The KRYN ATIS was reporting winds from the East at 10 knots, with gusts to 15. I phoned Mr. Stogsdill at about 1:15 PM and asked which runway was in use at 14AZ. He said they use 24 for arrivals as it has a 3% uphill grade and thus preferable even with a tailwind.

The takeoff at KRYN was uneventful as was the climb to 5,000 ft. and the flight to 14AZ. I called with intentions (122.9) when 3 miles out and upon entering right downwind, base and final for 24. I had no difficulty landing on centerline about 600 or 700 ft. from the threshold. The ground roll was faster than usual - which I expected due to the tailwind. I had to stay active on the rudder pedals but had no difficulty maintaining directional control. The plane began slowing down due to the uphill grade. As it slowed, I was being steadily pushed to the left edge of the runway despite holding full right rudder, left aileron and forward control. When I was about to be pushed into the drainage ditch between the runway and taxiway, I added power to keep the nose up. As I did so, the airplane immediately accelerated across the taxiway and into the adjacent mesquite trees in a matter of seconds. The plane came to an abrupt stop when the nose-wheel hit a small tree. I was not injured, owing to the four point restraint system I had installed for the front seats. After turning off the ignition, I exited the aircraft.

I've replayed the incident over and over in my mind - thinking of what I might have done differently to prevent the outcome. I have flown into far more challenging weather and airstrips. I've taken specialized instruction in mountain and canyon flying, and have done a fair bit of mountain and backcountry flying. So, even in retrospect, there was nothing wrong with my decision to fly to 14AZ that day. However, the combination of forces actually encountered during the landing roll were unusual. I have thought about my decision to apply power, rather than standing on the breaks, when it was clear I would be pushed into the ditch. The quartering tailwind made the plane feel unstable and I decided forceful breaking would bring the nose down and upend the plane. For this reason, I opted to add power.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I hesitate to recommend that pilots practice tailwind landings to experience uncommon forces and learn how to counter them.

I would observe that the startle response is not limited to engine failure but can be triggered by routine inputs that are not yielding expected results.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

The ELT, was activated, but couldn't be shut off by resetting control buttons in the cockpit. When Mr. Stogsdill was disconnecting the ELT he mentioned that the antenna wasn't connected.
