Multi engine lesson 56 with Matthew Elleseg, completed 1.0 of 1.4 total hours.

On our second touch and go we were cleared for the option on Rwy 36 in KOSH. This was a simulated single engine from downwind through base and landing. As is normal in a single engine situation the gear horn is going off the entire time the throttle is pulled back. The student missed putting the gear in the down position and I missed verifying that.

On a left base Matthew made a call that the final approach was clear of traffic which I attempted to verify visually.

With the exception of the gear the pattern was normal/routine.

We landed on Rwy 36 with the gear up.

When we came to a stop I notified tower of what had happened, shut all switches to the off position and exited the airplane. Airport personnel were present with a few minutes.

Matt Elleseg's summary

I am a non-endorsed private pilot who was practicing in my school's multi-engine aircraft (complex) for my commercial training. The lesson we (my instructor and I) were conducting was mostly single engine maneuvers. The aircraft is equipped with a gear warning horn, which was sounding for nearly 30 mins as I was performing single engine maneuvers. This makes me believe where the incident starts to take place. After flying for close to 45 mins in the air, my instructor told me to head back to the airport for some pattern work. Advising tower on my intentions I was told to report a 2nm right base for the option on runway 36. Profiles were demonstrated correctly and a safe landing was assured. On the go, we were told left-hand traffic and report all midfield downwind. My instructor failed my right engine (simulated) on the crosswind roughly 300' under TPA (1800' MSL). Established midfield left downwind, I made my call for the option on runway 36. I was cleared for the option and abeam touchdown point I added full props and 10 degrees of flaps. Turning base I added an additional 5 degrees of flaps. Turning final when landing was assured I added full flaps but forgot the most crucial part. Extending the landing gear. We made a soft touchdown and skid about 300'-500'. No injuries to either myself or my instructor and minor damage to the aircraft. I believe hearing the horn for a long duration in-flight made my mind think nothing of it. Throughout the process of landing the aircraft I do not even recall hearing the horn, even though I know it was sounding. It was my first single engine approach which spiked my stress level reverting back to my training of flying a "fixed gear" aircraft and subconsciously used those profiles and resulting in my failure to extend the gear.

Corrective actions: As a pilot, no one thinks this is going to happen to them. In reality it can happen to the best of us. Things that I have started to work on is chair flying landing procedures/single engine ops and using the correct profiles to ensure a safety of flight. I will also be retraining in my school's simulator to show myself and chief instructor that I am a great pilot who made a once in a lifetime mistake, who will learn from it and be stronger because of it.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

- Pilot & Instructor must follow established procedure
- Pilot & Instructor to undergo remedial training
- Installation of supplemental audio gear warning system with a too-low-gear annunciator
- Installation of a fake gear handle in C172S fleet to train proper gear management mindset from first flight on through law of primacy; C172S profiles to then match Be76 profiles
- Add additional call out of 'No-horn' to applicable profiles
- Formalize several gear verification techniques currently being used, by formally writing them into flight school procedures/profiles
