Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The nose landing gear collapsed. The fiberglass on the bottom cowling of the aircraft was cracked. The fiberglass wheel ferrings on both main wheels were cracked. The propeller was bent.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I departed 1W1 for KSLE on 4 Mar at 0800. The flight to KSLE was for a military promotion board. On the return leg to 1W1, I did a quick walk around, checked the fuel tanks and the oil. I departed around 1230. I took off on the main fuel tanks, and once airborne, I decided to burn from the right tip tank first. The right tip tank gauge broke approximately 2 flights after the annual inspection. I was aware the gauge was broken. The fuel in the right tip tank was not full prior to takeoff. I had estimated the tank was 3/4 full and that there was 45 min of fuel in the right tip tank. I chose to burn from the right tip tank for weight and balance. On the first leg, we had burned from the left tip tank. I had approximately 10 gallons in the left tip, I estimated 14 gallons in the right tip and 20 gallons in each main tank. After leveling off at 3500 feet MSL, I selected the right tip. I cruised for approximately 25-30 min on the right tip tank, and prior to arriving at 1W1. Upon arrival, I decided to do power on/off stalls. I executed the stalls 7 miles to the east of 1W1. The power-on stall was uneventful. The power-off stall was uneventful until immediately following the recovery. After recovering to level flight, I started a turn towards the airfield to land. At the time, the fuel pump was on, the carb heat had just been reset, the prop was full, and the manifold pressure had just been retarded to 25.0 inches of Hg. As we started to point towards the airfield, I noticed a loss of power and a drop in the manifold pressure. At the time we were 5-7 nm off the approach end of 1W1 runway 25. I assessed that if we did not regain power we would not make the runway, so I continued a left-hand turn towards the nearest farm field. It was the only area in the vicinity clear of trees and powerlines. We were at approximately 2,000 ft MSL after we pointed towards the field. At the time, the engine was still running and my assessment was that we had some sort of carburetor ice. I pulled the carb heat and there was no change. I elected to lean the mixture and attempt to cycle the mags. After attempting these three things, I decided I no longer had time to troubleshoot and needed to fly the airplane. At this point, we were at approximately 1000 ft AGL and needed to avoid trees, power lines, fences, and land in a field that was approximately 700ft in length. I landed about 50 ft past a fence in full flaps, at approximately 65 mph, started to apply brakes, raised the flaps, and applied full braking. At some point after touchdown, the engine stopped. As we were coming to a stop approaching another fence, we noticed an irrigation ditch across the field. We attempted to stop short of the ditch, but we were unsuccessful. We were doing approximately 10mph as the nose gear dropped into the ditch. The nose landing gear collapsed as we skid to a stop resting on the lower cowling. The main gear did not collapse. I shut off the master, pulled the mixture to cut off, and emergency egressed the aircraft. Neither occupant of the airplane impacted the dash. We did not have shoulder harnesses. After ground egressing, we waited for the fire crew to arrive prior to approaching the aircraft. Approximately 20 min later, the fire crew arrived and we approached the aircraft. They asked to turn the fuel selector to off to secure the aircraft, so I turned the selector off. I did no further assessment of the wreckage. The next day after thinking about the incident, I suspected I may have run the right tip tank out of gas. I returned with my mechanic to survey the site. The first order of action was to check the right tip tank fuel status. Upon opening the right tip tank, the tank was dry. It appears that the engine lost power due to fuel starvation.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

1. I believe the causal factor for the accident was not using a calibrated dip-stick to determine the amount of fuel in the right tip tank prior to departure and my willingness to use a tank with a broken gauge. The flight was a short flight and I assumed I would have 5 gallons remaining when I switched tanks prior to landing. I was aware the right tip tank fuel gauge was broken and still chose to burn gas from the tank without knowing the exact quantity to "even out the weight and balance".

2. I had an experience with carburetor ice three weeks prior in similar humid conditions and I was predisposed to worry about carb ice.

3. When I lost power in the engine, I did not suspect fuel starvation because the engine was still running. I did not check the fuel pressure and I did not attempt to switch tanks. Once I was pointed at the field, I should have started with a quick analysis of all gauges and settings. I checked fuel pump on, prop to full, throttle full, mixture rich, and checked the RPM and manifold pressure, but there my analysis stopped. I needed to check my fuel tank setting, my oil pressure, and my fuel pressure. I believe if I would have checked the fuel pressure I would have successfully identified the issue. However, there was only approximately 1 min and 30 seconds from loss of power to landing.

4. It is a problem that there was only 1 and 30 seconds from loss of power to landing. I should have performed the stalls at an altitude that allowed a longer duration of time in case of a loss of power or in case of a spin. I believe the last place this accident could have been avoided was during the analysis phase of the emergency. I needed to perform a complete analysis to include fuel tank setting and fuel pressure. If I had selected any other fuel tank, I believe the airplane would have regained power. I believe the primary reason for the incomplete analysis was due to the minimal time from power loss to landing. If I had executed the stalls from a higher altitude. I believe we would have had more time to analyze. The majority of my time was spent trying to avoid obstacles during the descent to land.
