Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Two Statements have been submitted to the Albany, NY FSDO. One statement has been submitted by the pilot of the towplane involved in the incident and the second statement has been submitted by the glider pilot who was involved during the aerotow operation. During conversation with the NTSB investigator (Kathryn Benhoff), she indicated that these statements could be utilized in this section of the report, and need not be entered here.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

When a glider balloons ("kites") behind a towplane, there is little to no time for the pilot to react in a fashion to avoid an aggressive pitching downward of the aircraft. At low altitude, this creates a nearly unrecoverable situation. A more rapid release by the glider pilot as a "kiting" situation develops may mitigate the risk of accident.

Additional considerations that may help to prevent future incidents include:

1. The glider involved in the towing incident has a "Center of Gravity" (CG) hook. These types of aircraft are designed for both winch tow and aerotow operations. In a winch tow environment they produce rapid lift over a relatively short distance. However, in an aerotow operation, they are more prone to "kiting." The "arm" length created by the tow rope attached to the tail of towplane results in significant leverage, which easily overpowers the elevator control of the towplane.
2. The rope release system on many towplanes is located on the floor of the aircraft. This location of the release makes it difficult for rapid release of the towrope in emergency situations. The human factor of trying to both release the towrope and provide upward elevator control is very difficult. Locating the release for the towrope in a more accessible location would reduce the human factor associated with emergency release.
3. Most towplanes have a rear view mirror system that is often ineffective during takeoff. As the towplane pitches upward on takeoff, it is hard to see the glider. More effective technology exists that could provide a better rear site picture, while still keeping the towpilots forward vision intact.
