NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I was flying solo. The airplane is owned by 10 members of the Bemidji Flying Club which includes me. On the day of the incident, I arrived at the airport at about 4pm (2200 UTC). I had called ATIS three times on the drive up to try to get an idea of how the weather was trending. At the time, the wind was gusting too much for me to feel comfortable flying. I made the decision to wait for the wind to go down a little and only to fly if no gusting was reported. I preflighted the airplane. I called ATIS at 6:34 to confirm that winds were decreasing. I decided to stay and see if they would remain at a level of crosswind I was comfortable with. They did on subsequent calls as noted above and I decided to fly when two ATIS reports were indicating 7mph and no gusting reported. I calculated a cross wind component to be 4 mph for runway 13. I thought I had waited a reasonable time between those last two calls, but my phone record indicates that I only waited 5 minutes to call again. I started the airplane at approximately 6:46 after calling ATIS the last time at 6:44. I took off and stayed in a left hand pattern for Runway 13. I made 4 landings, all on the center line with moderate crosswind aileron correction and forward slip with rudder. Approaches were normal, patterns were normal, light traffic was in the area for the first three, no calls on the CTAF for the last two. I was feeling good about being prepared for my check ride. The landing of the incident began with a normal downwind leg at 2400 AGL and 80mph, I called turn to base on CTAF (frequency 122.8), added carb heat, reduced RPMs to 1600, put in 10 degrees of flaps and turned to a 90 degree base leg for runway 13. I pitched for 65 mph on base and I stayed with 10 degrees of flaps. I checked right for traffic on final as I completed the base leg and then called final for runway 13 as I turned. I stabilized the approach with slight right aileron into the wind, opposite rudder to maintain alignment with the centerline and I reduced rpms to 1300. About ¼ mile out the wing banked left about 10 degrees fairly abruptly but I didn't think it was more than just a "bump" and I corrected with aileron. I slightly reduced throttle about 100-200 rpms. As I crossed the numbers, I added back in the 100-200 RPMS to slow descent slightly. Speed at that point was less than 60 MPH. I rounded out about at what I estimated to be 6 feet above the runway, transferred my visual sightline to the far end of the runway and fed in up elevator as the airplane decelerated until it touched down on the center line and aligned with the centerline. It touched down main gear first, but in a nose up attitude, it did not bounce or balloon. I maintained aileron correction into the wind and as I slowed, I increased it to full right aileron. As the tail came down, it felt like a gust picked up the right wing slightly. I already had full right aileron, but the wing rose an estimated 5 degrees. At that point the gear hopped to the right approximately one foot and the 4 inch gear extension casting that is part of the taildragger conversion snapped when the tire contacted the runway. The wheel less left gear leg then dropped about an estimated 10 inches and contacted the runway. At that point, the drag of the wheel less landing gear leg caused the airplane to decelerate rapidly and yaw to the left. I would estimate my speed at the time the gear leg contacted the runway surface to be 15-20 mph. The airplane stopped and nosed over fairly slowly and the lowest point of the left (drooped STOL type) wingtip contacted the runway simultaneously, or close to simultaneously with the lower cowl contacting the runway. I shut off the fuel lever and all electrical systems. After a moment, I turned on the main and made a CTAF call that runway 13 was blocked. I again shut off the main. At 7:28 I called Mark Cook, my instructor. After a few minutes, I checked for fuel leaking, turned on the main switch and made another CTAF call to warn of the hazard on runway 13. I again shut off the main switch. After a few more minutes, help arrived from the FBO and they took pictures for insurance reasons. I asked more experienced pilots there if I needed to contact NTSB immediately before moving the airplane and was told I didn't need to do so immediately because the airplane damage wasn't severe enough in their opinion and there were no injuries or property damage besides the airplane's damage. Other flying club members came out and we lifted the left wing and placed the damaged gear leg on a rolling trolley device, held up the left wing with several people and pulled the airplane off the runway and eventually to a hangar with a tug.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

- ☐ Avoid self-induced pressure to fly and prepare for my check ride after about 3 weeks of either the airplane being out of service or the weather being unflyable for my limits. I did have 1.5 hrs. of dual instruction the day before the incident.
- ☐ Avoid not waiting long enough to determine that the earlier wind gusts wouldn't return.
- ☐ Avoid touching down with the tail wheel not yet in contact with the runway, in other words not in a complete full stall three point attitude.
- ☐ Avoid failure to realize that the non-pilot induced slight but abrupt left bank on final approach indicated probable renewed gusting conditions.
