Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wing sheared off and substantial damage to fuselage. Airplane submerged in Gulf.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I was taking off to go home on Runway 5. Conditions were VMC. A large flock of some whitish, canary sized birds were on the departure end of the runway (approximately 300 of them). By the way, I noticed the same type of birds on the arrival end of the runway when I arrived 3 days earlier. They had scattered upon landing.

As I applied full power on the runway, all systems were in the green and power was full. Rotated normally at about 75 Kts, began climbout at about 90 knots, all engine systems were normal. Despite this field having a short runway, I lifted off the runway about 2/3 down. The climb speeds and power all normal. I was climbing out at 90 kts. the large flock of birds scattered off the departure end of the runway but a few of them circled back in front of me. I then hit a small group of these small birds (approximately 6 birds) this occurred approximately 4-5 seconds after take off.

I was only about 80-90' agl and climbing normally at the time of the bird strike. Prop then became unbalanced causing a violent vibration in the climb, then there was a steep bank to the left, then to the right- this all happened as I was still climbing. Following the bird strike, the speed then slowed to a stall, stall warning horn sounded, then made contact with the Gulf about 4-5 seconds later.

Entered the water banked at about a 60 degree angle to the left. The left wing was sheared off and flipped us around to face the runway we has just left. Pilot and passenger exited the plane about one minute later after impact. We sustained only minor scratches and a stiff neck. The water level where we crashed was only about 3' feet deep and we were about 80 feet from the shoreline. We were able to walk back to the shore from the crash site, where first responders met us, took our vitals and found them normal. So we were not transported to the hospital. I don't know how many pilots and passengers can both walk away from an accident of this type, but we thanked God, we did.

I attribute our lack of injuries to the following:

- 1) We were at a low altitude when we stalled, about 80' -90' agl.
- 2) The water landing absorbed some of the impact.
- 3) We entered the water at relatively low speed about 80 Kts,
- 4) The Cirrus cockpit has a type of roll cage that prevents compression and disintegration to the cockpit, unlike the rest of the plane, which was in many pieces.
- 5) the seatbelts were very effective.

Another note, winds had been strong coming from the Southeast (15+ kts), however, at the time we took off the wind sock indicated that the winds were from the East favoring runway 5. During our runup the Windsock even became limp at one point.

I only had about 50 gallons of fuel and one passenger, we were well below the gross weight limits.
