Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Right landing gear front leg broke at top mount; tip of fin and rudder damaged about six inches from top; all three propeller blades destroyed; cowling dented on nose bowl; upper and lower wings suffered damage from tips into the I-strut mounts; ailerons damaged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I had flown the aircraft, and experimental biplane of my own design, to Longmont, CO, (KLMO) for an airshow evaluation flight with an Aerobatic Competency Evaluator (ACE) for the purpose of renewing my Level 1 Unrestricted Statement of Aerobatic Competency (SAC) card. Having flown the evaluation flight, I then fueled the aircraft for the return trip to my home airport in Bountiful, UT, KBTF.

I took off on the main fuel tank (38 gallon capacity) and climbed for 5 minutes at a cruise/climb power setting of 25"MP & 2750 RPM. I then switched to the auxiliary fuel tank (17 gallon capacity), and began timing that tank with the LC-2 timer on the instrument panel. The auxiliary fuel tank ran dry at 1-hour 10-minutes. I then switched back to the main tank, which I believed to still have 35 gallons remaining.

I was facing headwinds on the return trip, showing ground speeds of 115-125mph, much slower than the 160-170mph on the trip to Longmont, so I made the determination to stop at Evanston, WY, (KEVW) for fuel, believing that there would still be 10 gallons remaining in the main fuel tank on arrival at Evanston. I had been cruising at an altitude of 9,000MSL, and with 6 miles from the destination showing on the GPS, I began to descend to pattern altitude of 8,000MSL, when the engine powered down. This was not the same feeling as when running the auxiliary fuel tank dry, which results in stuttering or hesitation of the engine. This time it felt as if the throttle had been pulled back to idle over about a 3-second period. Thinking that there was still 10 gallons of fuel in the main tank, I reasoned that the throttle linkage had somehow broken and the carburetor had gone to idle.

I had been flying about a mile north of, and parallel to, I-80. I immediately turned toward I-80 and established a glide speed of 85MPH, and pulled the prop control all the way back to high-pitch. Previous glide tests have shown that at 80MPH, with the prop pulled back to high-pitch, the a/c has a glide ratio of 6:1. Traffic was heavy westbound, but it was the closest lane to me, it was downhill, and it was into the prevailing wind. There were four semi trucks westbound that I thought I would be ahead of. As I turned west to line up with the freeway I thought to myself, "I have this made". I lowered the left wing slightly and gave a touch of right rudder to see what was ahead (the a/c is very blind on landing), and thought I was ahead of the lead truck. At that moment I struck something below me, the a/c was violently turned to the right and thrown downward. I felt a forward impact and tumbling, then the a/c came to rest inverted.

I looked around to see what attitude the a/c was in, then opened the canopy and released the secondary seat belt. I then grabbed a fuselage tube on me left side, and released the primary seat belt/shoulder harness, and lowered myself to the ground. I was completely uninjured in any way. Two men came to check on me, as well as local EMTs. I told them that I was uninjured and needed no medical attention.

A truck driver arrived a few minutes later and stated that I had landed on top of his sleeper cab. He only stayed on scene a short time, and after talking with Wyoming Highway Patrol (WHP) he left the scene. WHP called the FAA and NTSB, and I spoke briefly with the NTSB agent. The aircraft was moved by B&T Towing to a secured facility at the direction of the NTSB.

Following the initial investigation by the FAA, they found no fuel in the auxiliary fuel tank, which is expected, as I had run that tank dry. I returned with the FAA a few days later to show them the main fuel tank location, and to determine how much fuel remained in that tank, and to determine if the throttle linkage had failed. The main fuel tank was empty, and the throttle linkage was intact. This left us with the mystery of where the expected 10 gallons of fuel had gone.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I took off believing I had 55 gallons aboard. At 15gals/hr, this would give me 3 hrs 40 mins maximum flight time. I was 2 hrs 45 mins into this flight, and less than 3 minutes from landing at Evanston, when the engine quit. Reviewing my fuel receipts, I had one that showed 27 gallons purchased. This would be the exact amount I would have put in the a/c after the evaluation flight. So where did the 10 gallons go? Further investigation, checking my credit card activity on-line, showed another fuel purchase of 18.1 gallons. It then occurred to me what had happened.

My normal fueling procedure is: 1) open the covers of both tanks and loosen the caps; 2) fuel the main tank; 3) fuel the auxiliary tank; 4) close the auxiliary tank cap and cover; 5) close the main tank cap and cover. For reasons unknown to me, I fueled the auxiliary fuel tank first. Then, following my normal routine, I closed the caps and covers of both tanks, and flew away believing that I had 55 gallons aboard, when in fact I had only 45 gallons aboard. I had skipped Step 2, then fallen back into my routine.

The corrective action is obvious, in hindsight: The main tank should always be fueled FIRST, regardless of other circumstances. This simple change in my normal routine resulted in damage to my aircraft, and possible serious harm to myself and others. In the future I will open the cover and cap on the main tank and fuel it first, before opening the cover and cap on the auxiliary tank.
