Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Main rotor blades received damage to the tip of the five blades. Blades will be evaluated by the manufacturer for repair-ability, until that time the five main rotor blades will be replaced. No other damage to the aircraft. Property damage was reported as \$0 by the power line company.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The purpose of the flight was to take a lineman to the top of a power line structure and drop him off to conduct construction work attaching a fiber-optic line. After the lineman finishes his work, fly back to the structure and pick him back up by using skid transfer procedures from a hover near the top of the structure. This process was repeated several times. The line runs from the top of the ridge down to the valley on a slope and steeper at the top 2 spans.

I departed from the remote field staging area approximately 0.3 miles from the power line structures at approximately 1645. I made an approach the same way as the previous approaches on the last 3 structures. On approach to the structure I positioned the helicopter with the nose pointed down hill and into the wind putting the structure out my side of the helicopter on the left. This put the fiber line on the left side of the helicopter parallel to it and at an angle from the peak of the structure uphill to the next structure behind the helicopter and from the peak downhill to the next structure in front of the helicopter. The lineman conducted the transfer from the skid to the structure as normal from a hover and without incident and I departed to land at the Staging area. My lineman had radioed that he had finished attaching the fiber and was ready for me to pick up an external load of material. I flew back up to the structure with an external load long line and hook and picked up the load and flew it back to the staging area and dropped it off, and dropped off the long line. I departed to go back and pick up the lineman on the structure. I approached as before to a stabilized hover clear of the structure. The lineman was in the same location on the structure and was ready to conduct the transfer process back to the helicopter skid. I hovered in closer to position the helicopter in the same location where I had previously dropped off the lineman. I signaled that I was ready for the transfer. The lineman was reaching out to attach his safety lanyard to the helicopter when I felt the vibration of the blades contact the fiber line for a second before the fiber line broke and shot back away from the structure. It would have contacted to my left rear about the 7 to 8 o'clock position. The lineman was unharmed still standing on the structure holding onto the peak next to the left side of the helicopter cabin door. I hovered there momentarily and realized what happened. There was no erratic movement of the helicopter at the time of the blade contact and no yaw, surge or decrease of rotor RPM. I hovered clear of the structure, checked for controllability and found no problems, reported on the radio that I had a blade strike and flew directly to a known safe landing area nearby at approximately 1700.

After discussing the incident with the lineman he told me that the fiber line was in a lower position during the first transfer but was raised up higher when it was attached to the structure before the second transfer when the blades contacted it.

There were no injuries.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Assess each approach and landing individually, look for any possible new hazards or obstructions.

The preferred method and industry standard for conducting tower transfers with lineman is with the use of HEC (Human External Cargo). This incident would not have happened if we were still using HEC. This method is much safer because the helicopter blades will be well above the structure and lines. Unfortunately the FAA has taken away this important tool by a re-interpretation of the rule for the certification of the primary attaching means (Cargo Hook) for HEC. HEC has been used since 1966. There has never been an accident caused by a primary cargo hook failure during an HEC operation.
