Ref: Incident at 89TA "Soaring Club of Houston", 23 June 2018
Ref: Glider N123PW, PZL Swidnik model PW-5 glider

Dear Sir,

I have a total of 350 flights and 210 hours, all in gliders. Of these, 38 flights, and 53 hours were made in the past 12 months. Seven flights and 11 hours are in the 90 days preceding the incident. I have performed most of my flying at my home field at the "Faultline Flyers" gliding club, airport code TX23, 40 miles north of Austin TX. I have also flown out of three other airports in the last year. Most of my pilot time in the past year is in the plane under discussion, registration number N123PW, which I own.

The flight that ended in the incident under review, was my first flight at the Soaring Club of Houston (or "SCOH") in eight years. In retrospect, the first in a sequence of mistakes I made, was to fail to familiarize myself with arial landmarks prior to the formal soaring event. I could have arrived a day earlier when the airport was quiet, and taken a high tow when there was little activity, and simply flown several boxes around the airport in order to guage distances and landmarks. I did not do this.

The incident occurred on Saturday 23 June 2018 on the first practice day of the soaring contest. The ceiling was perhaps 2700 feet AGL, and wind was from 190 at 15 kts aloft. All altitudes in this statement are AGL.

I was towed aloft in my glider N123PW, at about 13:25. Following release from tow, I was able to find sufficient lift to maintain 2000 feet AGL but failed to climb higher. After perhaps 15 minutes, I was at the same 2000 feet AGL and 1.5 miles west of the airfield, abreast of the normal landing target.

In retrospect, at this point I should have either flow directly upwind to maintain this favorable position for possible landing and re-launch, or perhaps boxed the airport pattern to gain a sense of winds. Instead, I sought better lift under cloud formations further to the west. I flew an additional three miles to the west but did not find better lift. I then returned to approximately the same position I started from, 1.5 miles west of intended landing spot, but now at 1200 feet AGL.

Here, if I had flown due east on a base leg, I would have made the airport easily. Instead, after checking my angle to the intended landing spot, I decided that I had

sufficient height to fly a normal pattern and subsequently turned downwind.

My next and most significant mistake was to look at the altimeter, rather than to focus solely on my angle to intended landing spot. This reassured me that I had sufficient altitude to continue what I was doing. I used my spoilers during travel of the downwind leg to get to 700 feet AGL before turning base, which I think of as a "classic" altitude to turn base. This would have been fine if my position had been within the parameters of a correct pattern as adjusted for wind, but this downwind leg was more than a mile west of the field. I was also 0.5 miles too far downwind of the best pattern for those conditions with 15kt wind. In retrospect, I would not have made the mistakes with positioning if I had been focused solely on my angle to the target. The angle, if correctly perceived, would have made my positional errors apparent before I got so far out of position.

Because I had initiated my downwind leg so far to the west, my base leg would be more than a mile long (rather than a typical 2000 feet). The south wind at 15 kts also required that I crab the plane into the wind while on base, to avoid being pushed further downwind. With these factors, I was down to 200 AGL when I initiated my turn from base onto final. I was then 0.5 miles downwind of the tree line into which I ultimately collided.

At this point, it's likely that I could have still saved the landing by diverting my landing path to the eastern most extension of the SCOH airfield. I could have exited my turn just a little earlier, to fly in a SE direction to the extension, and skirted the treeline. While I did look at the extension as I was turning, I was so focused on my intended landing spot, that I continued on toward my original target. I had already mentally discounted the desirability of an alternate plan.

As I started flying along final, I had my first experience in the flight with flying directly upwind. I was surprised by how quickly I lost altitude for the progress I was making across the ground. I continued to believe I could clear the trees until the last few moments, at which time I pushed the stick down and then pulled up. It was too little, too late, and I collided with the tree line at about 13:45.

I was extraordinarily fortunate in the mechanics of the actual collision. The plane was slowed by the initial impact with smaller branches, then settled into a fork of one of the trees in a nose up attitude. The fuselage was mostly intact and I suffered no injury. I was approximately 10 feet off the ground. The rescue crew was able to remove the canopy, I was able to climb out of the fuselage and down the ladder without assistance. I was not affected physically in any way from the incident.

Since the incident, I have reviewed the flight with the instructors at both the SCOH and FLF gliding clubs. I flew several correct patterns with a senior member of the SCOH staff the next day. I have also arranged for flight instruction with the instructors at my home club, which will begin tomorrow morning at TX23 Fault Line Flyers.
