Narrative History of Flight

Donald A. Berg PIC
N7625Q
Cessna 421B

Around 10:15 a.m. on the morning of July 1, 2018, my wife and I departed Dallas Executive Airport (KRBD) with VFR Flight Following bound for Clifton Municipal Airport (7F7). Departure was completely normal and when we left Class Bravo airspace, approach control handed us off to Waco approach. When I began my descent, I told Waco approach of my intention to intercept left base to runway 14 in Clifton. He gave me the weather in Waco of clear skies, winds 190 at 14 gusting to 18 (as best as I can recall). When I turned final for 14, I configured the airplane for approach. By the time I was at 2 miles final, everything looked perfect to me. The glideslope indicator was one red light one white, gear down and locked, I had already put in 10° of flaps, and approach speed was right at 100 knots. The windsock showed variable winds from a quartering headwind to a direct crosswind. I elected to extend the flaps to full 30° and adjusted power to maintain the glideslope. At short final, and approaching the runway threshold, everything, winds, glideslope and air speed still looked good. As I began to take out power, and add a little left rudder for the crosswind, and near the threshold, very quickly, there was a sudden change in the sight picture of the runway out my windshield. I seemed low. Fairly quickly after that there was a very hard landing. There was no time to make any control inputs. The impact threw me forward with my head down. By the time I got my head back up, we had skidded to a stop some distance down the runway. With a glance outside, I realized the airplane was on its belly. I immediately turned both fuel selectors to shut off, moved the mixture to idle cutoff, shutdown the battery, shut down the electrical power and moved all the electrical switches to the off position. My wife had exited the airplane and very quickly I did the same. Neither I, nor my wife was injured with the exception of a small scratch on my wife's arm and 2 small scratches on my right eye socket.

I'm certain that the airplane did not stall. The airport runway is elevated with a valley perpendicular to the runway about 50 feet below the runway itself. So the south edge of the valley slopes upward towards the runway threshold. When I hit the ground, I believe my forward landing gear struck the upslope first, collapsing the nose gear, and shearing my right main gear as well. My fuselage struck the ground at the runway level and slid down the runway similar to a wheels up landing. I have no explanation as to the cause of the hard landing other than a wind shear near the threshold of the runway.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I'M NOT SURE, I BELIEVE WIND SHEAR WAS THE CAUSE OF THE ACCIDENT. I UNDERSTAND THE PHENOMENA IS DIFFICULT TO PREDICT. ON APPROACH I DID NOTICE A VARIABLE CROSS WIND, BUT IT WAS NOT SOMETHING ~~THAT~~ I HAVEN'T DEALT WITH BEFORE ON MANY OCCASIONS. I ALSO BELIEVE THAT THE ELEVATED RUNWAY CONTRIBUTED, AS WELL.
