STATEMENT:

On Sunday, 11 July 2018 at 0958, my DPE and I took off from Runway 33 at KFLY, Meadow Lakes Airport on my Private Pilot check ride. Winds were from the North at 9 mph with Density Altitude at around 9,400'. After completing the cross-country portion and then the required aerial maneuvers southeast of KFLY, we returned to the airport for landings.

Upon return to KFLY, winds had changed to coming from the East at 11 with gusts to 15, almost perpendicular to Runway 33. I completed a normal landing, did a touch and go, and remained in the pattern.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

The second requirement was a side slip to landing. Airspeed was a bit slow at the end of the landing with no stall horn warning, and it was a firm landing. Because of the crosswind, right aileron was required, so it was touchdown with right wheel, then left wheel, then nose wheel, and there was a bounce. I checked the left landing gear and asked the DPE to check the right side; there was nothing obviously wrong with either side. Rather than do a touch-and-go, I elected to exit Runway 33 and do a normal takeoff from Runway 33. The nose wheel "chattered" quite a bit, but this was a known mechanical condition and required a slightly nose-up attitude to take some weight off the front wheel to reduce the chatter. Otherwise, takeoff was normal, and I remained in the pattern for one more required landing to complete my check ride.

On the downwind leg to Runway 33, I thought the wind conditions had changed and believe the winds then reported by the AWOS were still from the East but now at 15 mph with gusts to 20 and Density Altitude at 9,800'. The wind sock near the end of Runway 33 was fully extended. Setting up for a short-field landing with a strong crosswind, full right aileron was required and applied. Two notches of flaps were used rather than the usual three notches of flaps due to the strong crosswind, and the approach was more demanding than the previous landings due to the crosswind. Touchdown was OK, but the aircraft quickly veered to the right. I applied left rudder to correct, then full left rudder with the DPE also on the left rudder. There was no response to left rudder input; the aircraft moved right and off Runway 33 into the grass between the runway and Taxiway Alpha. Both of us kept the left rudder fully depressed, and I tried to keep the nose up to protect the nose gear. The right landing gear hit the exit sign at Exit Alpha 5 and was bent backwards and up which probably caused the aircraft to turn farther to the right due to its dragging. A runway marker light was also damaged, but I do not know how. The aircraft came to a rest in the grassy area between runway Exits A5 and A4 and a few yards short of the Taxiway Alpha but not close enough to hinder use of the taxiway. I do not think I applied brakes because the ailerons were still in the 2d notch position, indicating to me that I had not brought the flaps to neutral, applied brakes, and raised the nose upon all wheels being on the runway for the short-field landing procedure before the move to the right commenced.

This event ended about 1130. Neither the DPE nor I were injured, and we quickly cleared the aircraft. The damage to the aircraft included the right main gear and the right horizontal stabilizer. The nose gear appeared to be fully compressed, but whether or not it was damaged was to be assessed later. There was no prop strike.

Thank you.
