Description of Damage to Aircraft and Other Property (Use additional sheet if necessary)

Main Rotor blades destroyed, Cabin deformity, Tail boom partially separated, horizontal Stabilizer Crushed, Instrument console detached.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Instructor picked up aircraft from helipad and hoisted taxied to Alpha Taxiway. When on alpha instructor gave the student control of the anti-Torque pedals to practice maintaining heading while hover taxiing. Instructor hover taxied east on Taxiway alpha to the intersection of alpha and bravo Taxiways. Instructor told student to turn left to align with bravo intersection and continue to maintain heading while moving north on bravo Taxiway. Instructor announced crossing runway 10-28 at bravo after visually clearing both 10 and 28 approach paths were clear. After clearing runway 10-28 on bravo instructor gave student control of both Collective and pedals with the intent of having the student practice heading and altitude control while instructor controlled the cyclic. The instructor and student hover taxied to the hold short of runway 4-22 and visually cleared the approach for runway 16. After clearing the approach the instructor and student departed over bravo Taxiway parallel runway 16 for a normal traffic pattern. Instructor handed off all controls to the student on climb out after maintaining a positive exchange of controls. At 500' msl the student turned right crosswind and continued the climb to the pattern altitude of 1000' msl. After reaching 1000' the student turned right crosswind. At midfield right downwind for runway 16 the student conducted the prelanding checks and announced lights off, gauges green, and pulled the carb heat to full. At 450 feet our intended point of landing we slowed to our approach speed of 60 kts and established a normal rate of descent of 300-500 feet per minute. Student turned for final approach at 500' msl with the intent of a normal approach ending in a hover. It was the instructor's intent to have the student experience the changing aerodynamic forces from transitioning from forward flight to a hover. At ground 5'agl student came back hard and slightly right on the cyclic, overcorrecting at the end of the approach. The right rear skid made ground contact and the helicopter immediately rolled right and the main rotor blades contacted the ground. The helicopter landed on its right side with the engine still in operation. Instructor looked around to make sure the blades were not in motion and asked the student if he was okay. The student said yes and the instructor told him to exit the aircraft. Instructor attempted to shutdown engine but could not but after a few seconds the engine stopped. Instructor unfastened seatbelts and exited the aircraft to join the student a safe distance away from wreckage.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The accident could have been prevented by maintaining a proper 3-5 foot hover. Not allowing the student any rearward or lateral movement while descending. Instructor intervention sooner in the future will be key to success.
