Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Damage to property: taxiway information sign

Damage to aircraft: engine/propeller; engine cowling; right landing gear (unsure about left landing gear); right side of wing, including wingtip; some damage to fuselage fabric in an area below the pilot's door (perhaps the result of debris from the broken sign); unsure about any internal damage to the structure of the fuselage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The flight was planned as a routine trip to Medford for my wife and me to spend the night and fly the next day to Tracy, California. Prior to departure from Vancouver, I contacted Leidos Flight Service for a weather briefing to discuss various options for VFR flight to KMFR. After discussing a coastal route with the briefer, I settled on the route down the Willamette Valley, because ceilings and visibility were good for overflying Aurora, by-passing Salem and Eugene to the east, then overflying Roseburg before continuing on to Medford. I confirmed this information using ForeFlight before loading the flight into memory on my iPad and the route into the plane's primary GPS navigator (Garmin 430).

We departed around 1425 local after contacting Portland Tower's Pearson Advisory controller to get clearance to transition over Portland International enroute to Eugene VOR. He assigned us a transponder code and provided instructions for the transition. After takeoff we contacted the tower on the assigned frequency. Subsequently, Tower and Approach Control gave us flight following and advisories to the edge of their Class C airspace at which time we were instructed to squawk VFR.

During the enroute phase, we contacted Aurora and Eugene towers for transition approval; both were granted. All other non-controlled airport frequencies were monitored as practicable.

About 10 miles from Medford, we received ATIS information Hotel, which was current. I then contacted the tower for landing instructions and joined a mid-field left downwind for Runway 32. A commercial flight was on final for Rwy 32, and we were cleared to land behind the landing traffic. As I turned base, it seemed apparent from our forward progress that the winds were stronger than the 7 knots noted in the ATIS information, but on turning final, I noted that the wind was pretty much down the runway with what appeared to be only slight fluctuations from the right, using the windsock as a guide. Nevertheless, I held some left aileron in as I set up for the landing and was proceeding straight down the runway at touchdown.

The landing itself was normal, and as I began to roll out, I turned slightly off the centerline to join Taxiway A2. Suddenly, there was a strong gust from our left, and the left wing rose sharply, starting to quickly turn the plane to the right. I cannot recall the next chain of events exactly, but I am quite sure I countered the gust with full left aileron, rudder and brake to try to prevent a groundloop, although the plane was not responding well as I neared the intersection. To try to lower the left wing, I added a small bit of power to try to keep the plane turned into the gusts and toward the taxiway while avoiding runway lights and the upcoming taxiway lights. (This would have allowed me the space to use both brakes while aligned with the gusts). There was a loud noise as the plane struck something I had not seen, and the plane veered sharply and came to rest with the engine stopped from impact. It was only after turning off the master switch, and shutting off the fuel that I realized that I had hit the taxiway sign.

I instructed my wife to exit the plane and wait for me a short distance away. Before turning off the electrical power, I received a call from the tower to give me taxi instructions, at which time I told the controller that the plane was unusable, that we needed assistance, and that I was shutting down the electrical system. I then turned off the master, while my wife exited her door. After checking that everything was properly shut off, I exited my door and joined my wife on the unpaved area to await whoever was going to arrive on the scene. Both front doors opened normally; we ascertained later that the right rear door operated normally as well.

After exiting the aircraft, we received help from the airport firemen, the airport operations staff, and, eventually, two mechanics from Jet Center, who brought equipment and, after being cleared by Tom Little of the NTSB to move the aircraft, fitted a dolly to the undercarriage and towed the plane to their facility and installed it in a large hangar.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

In retrospect, I think the only way to have prevented the collision with the sign (even if I had seen it), would have been to reduce power completely and with left aileron, rudder and brake, try to prevent a groundloop, while trying to stop forward movement completely. This is the practice I have always used in previous instances where a gust tried to upset the plane. In this instance, it happened amazingly fast, and the plane's reaction was quite severe, and although I have made many landings with strong crosswinds, this time I was taken completely by surprise.

The door latches operated normally. I had my wife exit quickly but carefully and walk away from the plane. I exited a few moments later.
