Eric,

Sorry it has taken so long to get this to you.

On Saturday, October 13 at approximately 4:00 pm MDT while washing my plane I heard an aircraft enter the pattern. The wind was about 5mph from the Southeast. About a minute later I looked up to see the Kit Fox on short final to Runway 16, from where I was working the plane appeared to be low and fast. The aircraft landed hard bouncing 4 to 5 feet back into the air, the plane settled back to the runway. It appeared that the pilot tried to give the plane power to recover, the plane started to fly about 2 feet off the ground turning left towards the East southeast. With wings level the plane flew for a short time, over 3 foot tall Chico brush, the left wing dropped into the Chico brush thus turning the plane left, the plane stalled into the brush tipping nose first then over onto its back. I dropped what I was doing and ran towards the plane about 1/4 mile away, when I got closer to the plane the pilot climbed out and waved that he was ok.
