Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The right main wheel snapped off on impact causing damage to the frame where the main struts attach also so to fire wall due to the nose wheel impact.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I check Lorain County Regional Airport (KLPR) AWOS numerous times during the day when I have a flight scheduled. The winds varied from 8 kt no gust to 14 kt with 22 kt gusts and they varied in direction from 130 to 160 degrees which is 90 degrees to runway 7. My last check of the AWOS was about 5 minutes before landing 9 kt with 16 kt gusts at 150 degrees. on final approach I crossed the threshold at about 10 feet AGL at 61 kt. Approximately 4 seconds later I was about 5 feet above the runway and around 55 kt and 1/2 second later I impacted the runway causing the right main wheel to shear off which I found 12 days later about 200 feet north of where I struck the runway. The wind speeds were within my Level of experience however I failed to recognize the risk posed by the rapidly shifting wind directions of 60 to 90 degrees to the runway. I was prepared to be hit by a gust on landing and having to go around as i've done it before which is why I had my flaps at 0 degrees but what I didn't consider was loss of headwind component while landing. A 10 kt wind that shifts from 140 to 160 degrees results in a little over 3 kt loss in headwind component and this aircraft stops producing lift at about 52 kt at 0 flaps so at 55 kt losing 3+ kt means its a free fall from 5 feet. Short of not flying that day the solution to the problem would have been maintaining about 62 kt to within 2 feet of the runway and then scrub off the rest of the airspeed landing at about 52 kt.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

First I would have had to recognize the risk posed by the winds shifting between 60 and 90 degrees to the runway (by the minute) and the affect this would have on airspeed. The solution would be to have added approx. 7 knots to the approach speed thus maintaining 62 knots to within 2 feet of the runway before bleeding off airspeed. Also I'm reassessing the maximum wind speed and direction of wind I'm willing to fly in.
