Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

One wing is broken, both sets of lift struts are bent, Engine mount is damaged and Engine will need an overhaul to check since propeller was suddenly stopped. Propeller will need to be replaced. Some mounts over cabin will need to be replaced.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On April 9 at approximately 1030 am, I was returning to the Sisters Eagle Airport. About ten miles out, I listened to the Super AWOS and learned that the wind was turbulent. I knew that the super AWOS is co-located with the windsock at the top of the main hangar and is normally unreliable other than for general information. I flew over the airport in order to see the most accurate wind indicator, which is a flag located on the fence which lies parallel to the runway. After noting that the flag was slack, indicating less than a knot of wind, I chose to land on runway 20. That runway had more of a headwind, although a NOTAM indicated that the first part of that runway was unusable due to flooding for the first 250 feet. As I entered the left base, I noticed that the wind had suddenly picked up, the direction of the wind still indicated a headwind, but the flag was fluttering, and the air was much more turbulent. As a result of that turbulence, I decided to sidestep to the dirt on the right side of Runway 20 in order to take advantage of the more forgiving nature of a dirt runway. As I touched down the turbulence was extreme, but the touchdown was relatively normal, although that initial touch-down may have been when the aircraft's rudder horn broke (that horn is constructed of cast aluminum).

Since, to avoid a bounce, I immediately applied a slight amount of forward stick, that amount caused the tailwheel with its broken horn to come back up and the tailwheel's position to be a non-issue. It's possible that it became an issue during the slowing roll out, when the tail came down and the off-center tailwheel caused a sudden veer to the left allowing the wind shear to cause the aircraft to pitch pole. A go-around was not indicated at that time, as the landing appeared rather normal. An experienced and very qualified eyewitness to the landing noted that the wind changed rather dramatically as the airplane began its rollout. Because of the wind shear, the wind suddenly changed to a tailwind, catching the horizontal stabilizer and causing the airplane to "pitch pole" and end up on its back. Both occupants of the aircraft then exited and received a clean bill of health from the EMT's who had arrived by that time. It's very possible that the incident was the result of that rudder horn parting which aggravated the pitching moment. In that case, the cause of the incident may very well have been a mechanical failure, the beginning of which would not have been caught by either the pilot, during his pre-flight inspection or the mechanics who did the annual and 100-hour inspection. The wind shear also affected the outcome of the landing.
