Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft sustained sheet metal damage to left wingtip outboard of last rib. Additional sheet metal damage immediately aft of the left landing gear. Left main landing gear shifted aft +/- 1/8". Left main gear, at wheel connecting point, toed in 1/4". One of two prop blades bent. Left upper door hinge broken.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The initial flight originated at KLEW and proceeded to KIZG where a full stop wheel landing was executed. An immediate departure for 63B was made after the full stop landing at KIZG. Radio calls were made at 10 miles and 5 miles out on the 63B CTAF advising of position relative to the airfield and altitude. Another radio call was made +/- 1 mile north of the field indicating intention to overfly midfield. Midfield was over flown and wind conditions checked via the wind sock. The wind sock was not extended and flight continued approximately 2 miles south of the airfield where a descending 180 degree turn was made in preparation for a cross wind entry for left downwind to runway 11 at pattern altitude. Upon crossing the 29 end of the runway a left turn was made to enter the downwind leg for runway 11. At midfield downwind mixture was set full rich and carb heat applied. Abeam the numbers (11) throttle was reduced to 1700 rpm and nose lifted to slow to white arc upon which time the 1st notch of flaps were set. Pitch was established for 80 MPH indicated and 500 FPM descent and trim set accordingly. Base leg was turned from downwind at approximately 45 degrees to the runway threshold. Second notch of flaps were set and airspeed slowed to +/- 75. Turn to final approach was made and final notch of flaps was set and airspeed slowed to 70 MPH in preparation for a three point landing. Upon crossing threshold power was reduced and nose was raised to slow decent and dissipate speed. Touchdown was normal and roll out had initiated with all gear on the ground and yoke in full back position. Suddenly the right wing lifted and heading began to turn toward the right side of the runway. Aileron input brought the right wing down however attempt to realign with the runway via rudder input was unsuccessful and the aircraft continued toward the right side of the runway. The aircraft left the right side of the runway rolling over a +/-8" tall snow/ice bank. The snow bank served as a ramp as the aircraft rolled over it and main gear left the ground for 2-3'. With no lift the aircraft again touched down moving ahead and sideways. With the sideways force the left main gear sank into the soft shoulder becoming a pivot that allowed the momentum of the tail to raise in the air. The Aircraft came to rest with three points of ground contact, the prop/spinner, the left main gear, and the left wing tip.

I was the only occupant in the aircraft and self extracted from the plane. There were no injuries sustained and no property damage other than to the aircraft itself.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Additional training and more flight experience in varying conditions. Develop quicker reaction response with appropriate control inputs to maintain proper control of aircraft in all phases of flight with concentration on landing and roll-out.
