Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Entire right side of AC is destroyed. Empennage is buckled and broken in multiple locations. Sever prop strike, crankshaft is 100% bent. Co-Pilot door destroyed. Engine cowl destroyed. Left wing tip and leading edge destroyed. Right landing gear torn out of gearbox. Pilot seat rails bent on seat base. Windshield destroyed

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

ATC cleared me to overfly Hill Field and upon entering Weber canyon at approximately 7600' AGL I noticed that there were no winds pushing me around. At the exit of Weber canyon and now down to 7000', the air was still ultra smooth. I made the appropriate radio calls announcing my position and intentions

At this point, I began a decent to pattern altitude 6000' for 42U –with the intention to go left pattern for 21 and take a good look at the windsock (no ATIS or AWOS for this airport). My pattern radio calls were made and there was no other traffic in the pattern (note: a local pilot had landed 10-15 mins in front of me on Rwy 3 to avoid any down canyon evening gusts)

On the left pattern for 21 I noted that the windsock was flat so I made my decision to land 21. At the numbers I was at 6000' AGL 85mph and 10deg of flaps. Before my base turn I went to 20deg flaps and slowed to 75 mph. My decent rate was about 1000 FPM for a short distance. Before my turn to final I went to 30deg flaps with 500FPM decent rate and 70mph. Across the fence I was perfectly centered on the runway at 68mph. I touched down with a wheel landing about 2-3 blocks past the numbers at 60mph. Upon touchdown I remember thinking "that was a good landing". Immediately after that the tail went to the left and raised up a foot or so, which made the nose go right. I attempted to correct and get back to the centerline. I believe I over corrected to the left and then to the right and then back to the left. At this point a full ground loop was in process I throttled up and got the ground loop stopped with the plane straightened out but exiting the paved surface at about a 45deg angle. I left the 30deg flap in place with full throttle and I believe I had gained about 18" of elevation above the grass apron. The left wing then struck a large bush which twisted the AC to the left and then the right wheel struck a soft dirt berm/mound about 24" up and pitched the AC onto its right side. Progress was halted. Then engine was stopped and I exited the AC out the CP door (it was gone). 30 seconds after I cleared the AC and could see I was uninjured and there were no flames, I went back and turned off the mags, removed the key and shut the fuel off.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I should have been more aware of down canyon wind gusts at dusk for this airport.

Perhaps a low fly-over could have revealed the down-canyon gust. Regardless, this would have been a good decision for a mountain airport I had never landed at during dusk conditions

My initial impressions on approaching the airport were to land on Rwy 3.....I should have listened to that!! (I wanted to see the wind sock to better determine best landing direction which meant a left downwind for 21 to get a good look)

At the first oscillation to the right (when the little gust hit the tail) I should have throttled up and done a go around. Instead, I tried to save the landingbig mistake

I should NOT have throttled up in the third oscillation, during the ground loop process. I should have just let it swing around onto the dirt grass apron.
