Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Propeller separation from crankshaft, Landing gear separation from airframe. Both right and left ailerons, right flap, horizontal stabilizer, left elevator, right and left wings and engine cowling damaged.

Property damage consisted only of breaking two sets of power line wires

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I stopped at the private strip at approximately 2:50 MDT to retrieve some items that my passenger had forgotten with the intent of returning to CO7. On landing it was observed that the wind was light from the south presenting the two available runways with the departure option of a tailwind on both due to gradient of the strips. I choose the runway used due to the lesser height of power lines above the runway surface. I had departed this runway before therefore I had experience and expectations from previous performances that this departure could also be accomplished safely with very similar conditions. I taxied to the defined end (ditch and small bush in runway) set the engine controls, set wing flaps to 10 degrees, trim to take off. Advanced the throttle check instruments, read good. There is two step downs in this runway the first and largest at approximately a thousand feet where I had expected to fly off the lip. At that point the plane, visually had accelerated well and audibly it was making the normal noise. At the step I checked the airspeed and AOA they where close but still slow in the time it took to assess this I felt that I had gone beyond a safe shut down point I elected to continue in the belief that it would obtain the required acceleration to depart and clear the lines. At or near the departure end I attempted rotation the aircraft came off the ground but failed to climb sufficiently to clear the lines. Hitting the first set of lines slowed the flight I could feel the approaching stall so I pushed it over to maintain flight speed which squared me up with the second set of lines. The first set of lines cut/broke easily but the second set entangled on the aircraft. Flight path continued forward but descending we struck an embankment the main landing gear collapsed and from there we decelerated in about fifty feet. The aircraft remained intact. The left/pilot door had come off its hinges so I and the passenger exited the aircraft on the left. Pilot and passenger walked away with only bumps and bruises.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

With no evidence available I believe it is possible that the tailwind increased in velocity increasing my take off roll. At the post accident site the wind would gust to a higher than light and variable.
So in concluding a prevention to the accident determining a more precise go no go point leaving me enough deceleration space would of helped.
