Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Landing gear collapse; Prop strike/engine stoppage; Buckled lift strut of right wing due to being struck by landing gear.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On the afternoon of 5/22/2019, I took off with one passenger for a local sightseeing flight and to do some touch-and-goes at KLUU, where the aircraft is based. The wind was very light (4-6 KT) out of the southwest, therefore favoring runway 27 with a very slight left crosswind. I completed one touch-and-go without issue. During the second landing, the aircraft main wheels touched down normally, directly over the centerline and tracking down the runway. The tailwheel was slightly airborne. The aircraft tracked down the centerline for 2-3 seconds without issue. As the aircraft continued to slow, the nose began to swing towards the left side of the runway (tail to the right.) I applied full right rudder input, however, there was little to no change in the yaw. The control stick was fully aft/nose up, but the tailwheel unlocked (castered) when it contacted the runway due to the yaw already in progress and was not assisting with directional control. As the aircraft began to leave the centerline, I applied engine power to increase airflow over the rudder in an attempt to regain rudder effectiveness. The yaw slowed and the aircraft began to straighten out and turn back to the right, however, it went into the grass on the left side of the runway. As the airplane continued its correction back toward the runway, the landing gear was damaged by ground contact and the aircraft slid to a stop on its belly with the nose pointing towards the runway. The lack of propeller clearance caused a propeller strike and engine stoppage. I do not believe either wingtip struck the ground, however, the damaged right landing gear struck the right wing front and rear lift struts, causing them to buckle and the right wing support to be compromised. Neither myself nor my passenger were injured.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This incident could have been prevented by more quickly and positively ensuring tailwheel contact with the runway. The yaw towards the left side of the runway occurred at a critical moment when the tailwheel was not yet firmly in contact with the runway, but rudder effectiveness was minimal due to lack of airflow over the surface caused by blockage by the fuselage/forward aircraft structure, as well as low airspeed. Contributing to this situation could have been the relative sense of safety due to the very light/nearly calm wind conditions that would normally be cause for a yaw or weathervane into the wind.
