Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Right Main Landing Gear, Propeller, Right wing tip area, Upper rear fuselage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Had not flown the incident aircraft in about a month. Just flown the Navion, and wanted to get some currency in the Luscombe. Winds were gusty and mostly from the south and crosswind, varying in both direction and speed. ASOS was reporting I believe 190 at 9, so I initially planned to take off runway 22. There was another aircraft in the pattern using runway 04. I observed the windsock at midfield and it appeared to favor 04 slightly, so I used that so I switched to that runway as well. Performed two touch and goes, all was normal. Performing my last landing to a full stop. Other than a pretty stiff crosswind on base, the landing seemed normal. On the rollout, the aircraft began to drift to the left. I countered with right rudder but had no response. I added power (about 1/2 throttle) in an attempt to regain rudder control authority. That action slowed the drift somewhat, but the aircraft was still going to depart the runway. I added full throttle, full right rudder in an attempt to reject the landing. I got the aircraft airborne just prior to departing the paved surface. I initially thought I had made the save, but the aircraft stopped the climb, and slid tail first onto the ground. The right main collapsed shortly thereafter, prop strike and the right wing tip impacted the ground. Slid to a stop and egressed the aircraft. Fairly rough terrain.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Winds were not steady and the direction was variable. My attempt to reject the landing most likely caused far more damage than had I just allowed the aircraft to depart the runway. I also should have probably tapped the right brake in order to gain some more directional control, unfortunately I rarely use the brakes for directional control, mostly on taxi and never had the occasion to use them on a take-off or landing rollout. I suspect I picked up a quartering tailwind on the rollout and I had insufficient runway to get decent flying speed, before she settled back on to the ground.

I should have paid more attention to the winds and had a better game plan for the rollout. Learned a couple lessons that day. Rejecting a landing not always the best/safest course of action. Obviously.

I suspect a windshear event, but can't corroborate with any data.
