Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Prop strike, damage to cowling and spinner, engine stoppage (extent of engine damage not known), windshield broken, damage to left wing (dents in leading edge and possible damage to fuel tank supports, bent left main lift strut, damage to tip of vertical fin, damage to gas caps and filler necks on both wing tanks.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I departed VFR from Ak-Chin Regional airport remaining clear of the Phoenix area class B and D airspace. The flight up toward Sedona was not remarkable with the exception of a little turbulence crossing some of the mountain ridges en route. I checked AWOS when well south of the Sedona airport to check winds and altimeter. At the time, reported peak gust was less than 20 kts, and winds were under 15 kts, variable from 140 to 160 degrees. This checked within the crosswind capability of the Taylorcraft. I proceeded to the airport, changed radio over to CTAF and proceeded into the traffic pattern for runway 21. During the first attempt at landing, I experienced some terrain-induced turbulence on final, due to winds over the bluff and surrounding rocks, and had a sightseeing helicopter depart across the runway forcing a go around. On the second attempt, flew the pattern, encountering the same terrain-induced turbulence on final, and touched down for a wheel landing. As the tail settled, the aircraft got hit by a gust, but the sensation was as if it was pushing me forward, instead of sideways, as I was expecting. At this time the tail started to rise even though the yoke was fully back, and efforts to get it back down were not successful. The aircraft nosed over, causing the damage listed above. The aircraft came to rest on its back, approximately 200 feet past the non-precision TDZ bars on the approach end of runway 21.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Not sure exactly how this could have been prevented short of not flying -- the wind seemed to do something totally unexpected based on the information that was available when I checked weather before departure, SEZ AWOS en route, and the wind socks on the approach end and mid-field that said I would have a quartering headwind from the left, instead, the gust essentially seemed to act like a localized tailwind.
