Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wing tip (18") and left aileron is substantially damaged from coming into contact with pavement.
Left elevator minor damage from coming in contact with pavement.
Propeller substantially damaged from coming in contact with pavement.
Main landing gear damaged from collapsing.
Under belly of airplane has damage from landing gear collapsing.
Unknown damage to engine from abrupt stop.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On June 4, 2019 at approximately, 1500 Local Time, N8685S, a light civil Cessna150 tailwheel aircraft, sustained substantial damage when it encountered a ground loop during the landing roll at Renton Municipal Airport (KRNT), Renton, WA. Visual Meteorological conditions prevailed at the time of the accident with ceilings and visibility unlimited. The winds were 240 at 06 knots. The flight was a training flight with the aircraft owner at the controls as pilot flying. The owner was a Private Pilot receiving instruction from a certified flight instructor under the provisions of Title 14 CFR Part 61 towards a tailwheel endorsement.

The aircraft owner met the certified flight instructor for a planned lesson at approximately 1420 local time. A routine preflight and flight brief was performed with no anomalies or inoperative equipment noted. The aircraft was noted to have approximately 26 gal of fuel onboard and was verified within the certified weight and balance envelope. Planned route of flight was from KBFI to KRNT and back to KBFI with multiple practice landings at KRNT. The aircraft start, taxi, run-up, and takeoff were conducted in accordance with the pilot operating handbook (PoH) and were uneventful.

Once airborne contact was made with Renton Tower requesting a touch and go for runway 34, which was approved. The traffic pattern and approach to landing were smooth and uneventfully conducted in accordance with the PoH. The flare prior to touch down was slightly high leading to a mild "hop" after touchdown on all 3 gear. After the aircraft settled to the runway, it began a drift left of centerline. In an attempt to correct back to centerline, the student/pilot flying applied full right rudder. The flight instructor then immediately applied full left rudder and brake in an attempt to stop the impending ground loop. The forces generated from the corrective control inputs, while not sufficient to keep the aircraft under control, delayed the onset of the ground loop. The airplane continued to deviate to the right as it decelerated down the runway. At approximately 100 degrees of turn and 222' from touchdown, the right main lifted off the runway due to momentum. With the entire aircraft weight on the left main, the side load exceeded design limits causing the left gear to collapse and fold under the aircraft. Without the support of the landing gear, the left wing and propeller both impacted the pavement resulting in substantial damage to the left wing spar and aileron with the aircraft coming to rest on the runway, approximately 75' right of centerline and after approximately 150 degrees of turn. The aircraft was secured and the crew egressed uninjured. An examination of the airplane's systems, conducted by the FAA, revealed no anomalies.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Even with a light crosswind, proper crosswind landing technique should have been applied during landing, along with less initial rudder input when correcting back to centerline.
