NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Our lesson today included introduction to VOR navigation, GPS navigation, compass turns, and unusual attitude recovery, as well as a review short and soft field takeoff and landings. I spent about an hour on the ground introducing VORs to the student, as well as covering unusual attitude recovery procedures. The plan for the flight was to depart for the practice area, introduce the previously mentioned items, and then return to HUF for some takeoffs and landings. We departed HUF off runway 5 around 2:15pm, and used the VOR to track to our practice area. I picked up VFR flight following with Hulman departure for local maneuvers. After introducing VOR navigation, I put the student under the hood for unusual attitude recovery procedures. We spent maybe 15 minutes covering unusual attitudes before switching to magnetic compass turns. By the time we were done with these maneuvers, we had been in the air for roughly an hour, we were in the northwest practice area, and we picked up the ATIS to head back to HUF for pattern work. We were given clearance to enter a left base for runway 5, and then to make right closed traffic after our landing. The winds were a 40 degree crosswind and gusting around 20 knots, so throughout the approach, I reminded the student of appropriate crosswind corrections. I also shadowed the student on the controls ensure that we would make a safe landing. We maintained around 60-65 knots on final for our first landing, which is appropriate for our airplane, but as the student flared, he did not put in the appropriate crosswind correction, we ballooned, and found ourselves to the left of the centerline and in a nose high, low airspeed situation. At that point, I told the student to go around, and he executed a normal go around procedure. Throughout the pattern I reminded the student about the importance of crosswind correction, and how not using enough can put us in a dangerous situation, like what we experienced. I also recommended to pull the throttle idle a bit earlier, and that we begin the roundout and flare closer to the runway, in order to avoid ballooning. Again, I shadowed him on the controls. On the next approach, we were stable around 60-65 knots on final, but again, the student flared too early and ballooned. We were in a nose high, low airspeed situation, and we were rapidly approaching the left side of the runway, so I called for a go around twice or three times within a few seconds and tried to take control of the airplane myself. The student had a very strong grip on the control stick, so I was unable to make any significant control inputs, and as a result, the go around was not initiated fast enough, so we hit the ground and skid off the left side of the runway.
