Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The incident took place on a mostly grass field on a sunny day in light wind at Merrymeeting Airport in Bowdoinham, Maine on the morning of Friday, June 7, 2019. The plane, a PA-28 Piper Cherokee 140 with a 160 hp Lycoming engine, is based in Brunswick, Maine. After practicing some slips at altitude in the Bowdoinham area, I decided to demonstrate to my student soft runway landing and takeoff procedures at Merrymeeting at about 10 am. This is the airport I had trained at and that I was comfortable with having over 150 takeoffs and landings there. We noted light wind on the indicators slightly favoring runway 32 as we over-flew mid-field at 2,000,' so I radioed our intentions, had the student pilot make a descending teardrop turn to the right, and we entered the left downwind. We landed without incident. I was at the controls for final approach, landing, and post-landing where I kept our speed up and full back pressure then back-taxed on 32 to depart with the normal 10 degrees of flaps. At full throttle and yoke full back, the grass was soft and wet and making too much friction, so I throttled back and taxied to the 14 end of the runway then off to the side to shut down and re-assess our options. One of the airport owners was at the field, so I went to speak to him about conditions and walk the runway. We both noted that this end of the runway was much dryer and had less grass including some exposed dirt. We both felt that the 160 hp Cherokee could be up in less than 1,000' on this relatively cool, dry morning and before the wet soft grass beyond. I made the decision to make the attempt. We restarted the engine and about 10:30 am, and I taxied to runway 14 keeping full back-pressure and keeping the airplane moving, put down 10 degrees of flaps, lined up and I applied full power. The airplane responded normally although not accelerating as well in the conditions. I got the nose wheel up at what I believe was about the halfway mark of the 1,900' runway, but we now had the mains in the wet grass and were not accelerating well. We became airborne at about the 2/3 mark, and I quickly noted the airspeed was not adequate at about 65 mph. Best angle of climb for the Cherokee is 75 mph. I could see the tall trees beyond the end of the runway in the windscreen, so my best decision in the interest of safety and getting the plane back down on the runway, I pulled power and brought the airplane back down. I maintained directional control straight ahead and applied braking, and, due to the slick conditions, we exited the end of the runway and down an embankment where the right main gear struck a large rock hidden under the tall grass. We veered right down the embankment then slid across a gravel road and came to rest in a yard near a small pine tree. At some point, the right main gear separated from the airplane, but it was directly behind the right wing where we stopped so must have separated very near the end of the slide. We quickly shut off fuel and shut down all systems. We exited the aircraft, and there were no injuries.
