Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aluminum skin at the end of the left wing is crushed and torn. Movement of the left aileron is impeded by the wing. The fireman examined the runway and reported seeing no visible damage, marks, or paint. No other property was damaged.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The flight began on 16 July 2019 at 8:20 am PDT from North Las Vegas Airport (KVGT) with 3 passengers. A VFR flight plan was opened with Reno FSS. The route of flight was east through the Grand Canyon Special Flight Rules Area (SFRA). After leaving Las Vegas Bravo airspace, I climbed to 9,500 prior to entering the SFRA. I entered the SFRA just east of Pearce Ferry Airport (L25), flew southeast to the Bat Cave, then northeast toward the Tuckup Corridor, while climbing to 11,500. I flew north through the Tuckup Corridor, then made a left circle while descending to 10,500 and flew south through the corridor. Then I flew southeast toward the GUCRU waypoint to intercept the V 208-210 airway about 13 nm southwest of Grand Canyon airport. Upon leaving the SFRA, I began a descent to 9,500. At GUCRU, I turned toward the KGCN airport and began a slow descent to 7,600. I received Grand Canyon ATIS information X-Ray giving an altimeter setting of 30.24 and winds of 210 at 11 gusting to 19. I contacted the Grand Canyon (KGCN) tower at 9 nm southwest of the airport and was given clearance to enter downwind, right traffic for runway 21 with instructions to report abeam the tower. I entered downwind, but before reporting abeam the tower, the tower contacted me with clearance to land runway 21 with instructions to not descend below 7,200 feet until on final. While on final the tower reported a wind direction change to 200. A left cross wind was confirmed by the drift of the plane to the right. I established a slight left-wing down attitude to compensate for drift and slight right rudder to align with the runway. The plane remained aligned with the centerline throughout the final descent. Upon crossing the threshold, I reduced power and began the round-out. The plane was aligned with the runway centerline and we were very near touchdown when suddenly the plane rolled to the left and the left wing contacted the runway. The plane immediately righted itself as we simultaneously touched down. The roll action caused a minor misalignment of the aircraft with the centerline so only mild right rudder was needed to gain runway alignment again for deceleration.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

On future flights, when winds are gusting, even in alignment with the runway, I will land with no flaps. This will give the aircraft a higher speed throughout the round-out, which may prevent stalling of a single wing.
