Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left wing and vertical tail were broken.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The aero-tow take off was uneventful. The canopy sliding vent was left open because the day was hot (90 degrees F). During take off, the open vent was making a very loud noise within the cockpit and at around 1400 msl, I slid the vent closed with my left hand. The vent has a built in airscoop so it still allowed fresh air to enter the cockpit. Within 10 seconds after this, the right-hinged canopy popped opened. The canopy frame wedged against the leading edge of the right wing. I released the glider from the tow plane and raised the glider's nose to reduce the air speed. With this maneuver I was able to grab the canopy and close it. I made a right turn of 180 degree and aimed for run way 5. I realized I had good altitude and decided to open the air-brakes as I was in final . Within a few seconds, the canopy reopened. I managed to close the canopy and held it with my left hand while my right hand control the glider for landing. The air-brakes, while unlocked, self deployed and dropped the altitude very quickly. The glider landed short in the parking lot of the warehouse next to the airport. Before touch down the left wing hit the top of one of the shipping container, bounced off and landed about 20 feet away.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

As glider pilots, we were trained and certified once basic skills and knowledge satisfied the established requirements. I am not aware that training to fly a glider with a canopy open during flight as part of the curriculum. This lack of awareness had misguided my priorities. Had I known (or trained) to know that one can leave the canopy open and can still fly the glider, it would have had a different outcome. The other options in this scenario:

1-I could have let go of the canopy and lock the air brake, re-grabbed the canopy and completed the final. Aiming for the runway and the glider was coming down fast, I would not have enough time for that maneuver.

2-One of my colleagues suggested to jettison the canopy. That thought did not cross my mind. Besides, the fact that a released canopy and potentially hit the pilot's head and caused serious injuries.

I plan to take remedial training recommended by the FAA. I had discussed with a CFIG about training for flying with simulated canopy open during flight.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

Further thoughts:

It was a hot day and I was working on the glider putting it together 2 hours before.

The latch mechanism has become less tight as everything expanded in that temperature 90 F

The Ventus 2ax is a small cockpit version. It was a tight fit in the canopy as I am 5,7 155 lb plus a parachute , the pilot has only enough room freedom of the arms and the lower legs. When I moved my left hand forward to close the window vent, part of my left hand might have touched or brushed against the knob of the canopy latch and pushed it to open (forward) position. I was not feeling my hand touching anything else while I was closing the vent, this perhaps explained due to my focusing on following the tow plane and on that hot day , things seemed looser and the canopy was easily unlatched.

I HEREBY CERTIFY THAT THE ABOVE INFORMATION IS COMPLETE AND ACCURATE TO THE BEST OF MY KNOWLEDGE
