Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Damage to right wing tip and right wing strut. Sudden stoppage to engine and bent propellor. Vertical stabilizer tip cap cracked.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 10-12-2019 at approximately 1515 hours I was conducting primary flight training with a student pilot (SP) at KHMT. We were on our initial approach to runway 23 and I had the SP fly down the runway at approximately five feet off the ground in landing configuration 70mph/40 degrees of flaps to learn what the landing attitude looks like prior to touching down. Approximately midfield I instructed the SP to execute a go-around. SP pushed in full throttle placed the carb heat back in the cold (in) position and started a gradual climb. After establishing a positive rate of climb SP moved the flaps from 40 degrees to 20 degrees.

As we approached the end of runway 23 I immediately noticed several dust devils beginning to form and moving left to right in the open plowed fields located at the end of the runway. I instructed the SP to begin a slight left turn to the left of the dust devils in an attempt to continue our climb out and not fly through the dust devils. It became apparent very quickly that we weren't going to be able to clear the dust devils on our departure heading and I told the SP I have the flight controls and continued a slow left turn into the quartering headwind attempting to take advantage of the winds from 140 degrees at 6 knots. I noticed the climb rate was approximately 200fpm and in my opinion with our current airspeed, altitude, climb rate and distance to the wires I wouldn't be able to clear them. I continued to make a slow shallow turn to the left to avoid and parallel the wires and poles along the road that is adjacent to the end of runway 23. I observed a plowed field immediately to the left (south) of the runway and told my SP that we can't clear either the wires at the immediate end of the runway or the high tension lines on the south side of the airport and I was going to make an emergency (precautionary) landing in the field to our left.

I lowered the nose of the aircraft to preserve our airspeed and informed the SP to brace for impact. I ran the forced landing checklist, made a mayday call and opened my door prior to landing. The soft field approach and landing was uneventful and the aircraft rolled for about 200-300 feet while I attempted to keep the nose wheel of the ground as long as possible due to landing perpendicular to the deeply plowed furrows. As the nose wheel touched the ground the nose gear dug into the two to three foot furrows and the aircraft came to an immediate stop and flipped over on its back at slow speed.

I immediately asked the SP if he was okay and when he replied yes, we executed the emergency engine shutdown checklist and exited the aircraft unassisted. Local police and fire/rescue responded immediately and met us as we exited the airplane. There was no post incident fire, the ELT didn't activate and there were no injuries.

I notified March Air Reserve Base personnel and they started their aircraft incident investigation procedures. NTSB was notified and I filed a verbal report with the Western Pacific Regional Office. NTSB completed their initial investigation and released myself, my SP, and the airplane to USAF personnel.
