NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The plane was an experimental kit built Sonex, the engine also being kit built. The air worthiness inspection took place Sept 5th. The first flight was Sept 19th. As is typical at W10, if wind is not an issue, takeoffs are from 16 and landings are from 34. The first takeoff was uneventful and the field was circled several times and then an uneventful landing was made on 34.

The second flight took place on October 5th. The takeoff once again was made on 16, the field was circled at about 5000 feet for about a half hour, then an uneventful landing took place on 34.

The third and final flight was made on October 11th. Weather was clear and nice. An uneventful takeoff took place on 16 and altitude of about 5000 feet was achieved. The field was once again circled to the left for about a half hour. Full RPM of about 3000 was maintained in order to facilitate engine break in. About this time, I noticed the oil pressure was running low, so I decided to do a cruise descent just to be safe. I lowered the nose and adjusted the idle to descend about 500 fpm. I wasn't overly concerned about the engine, but I thought I would land and check it out. I entered a left pattern for 34 and ended up at the point to turn final a little high. This is where I believe the poor decision chain began. The airport pattern was empty, and I thought I hadn't really tried much turning to the right yet, so I began a 270 degree turn, which would end up lining me up with 34 for landing. My research had shown me that most Sonex pilots use 20 degrees of flaps, so I inserted those. The 270 took longer than I expected, and I ended up left of the direct runway approach, and also too low. I should have pulled out at this point and performed a go-around. I don't know if the low oil pressure was on my mind and I thought I would continue on, but I did. The plane was descending faster than I expected as I wasn't accustomed to the effect of the flaps. I was skimming the tops of the trees and I thought I was OK and was going to intersect the direct runway approach a bit low, but fine. I almost made it, but a single tree I hadn't seen suddenly appeared and I struck it with my left wing.

The plane crashed and flipped upside down. I was able to crawl out of the destroyed canopy. I did remember to shut the fuel off before exiting. I crawled about 20 feet away and shortly after the plane caught fire. Fortunately, although the airport was almost deserted, the smoke was seen and help soon arrived.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

1. Transition training. Especially in the use of flaps and descent characteristics. I was accustomed to a Taylorcraft with no flaps and a long glide, and I underestimated the speed of the descent with the flaps. I thought I could handle the plane, but obviously I made a mistake.
2. Pattern flying. I made a mistake altering the pattern, especially with a new plane.
3. Smarter flying. I should have never cut things close, but left myself a lot of room for error.
4. Go around. A go around would have solved the problem.
