NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State time and point of departure, intended destination, and services obtained. I was on my seaplane ASES checkride and had just taken off from KHII with the DPE Moe Martin. Before takeoff, I used all checklists and gave a briefing. I departed the pattern to the west heading to the lake area. The DPE advised me to demonstrate a landing to a full stop on the lake. I began by reducing the power to 15" of manifold pressure and applied 10 degrees of flaps. The aircraft began to slow to the desired airspeed of 80 Knots. When the aircraft slowed to 80 knots I added 10 more degrees of flaps and began to set the approach attitude per my training. When the aircraft began to touchdown the aircraft pitched nose down and ended on its back with the DPE and I inside of the cabin. The cabin of the aircraft flooded with water within seconds and I tried to open the door to exit the cabin. After a while the door was unable to open and I began to search for other options to exit the cabin. I was starting to take in water into my lungs when I was finally able to open the window on my side. I tried to exit the cabin but my seatbelt was still attached so I reached over and unlatched it and exited the cabin. Once I reached the surface, I cleared my lungs of water and started to dive back into the water to help the DPE exit the cabin when I noticed that he had also exited the cabin from the same window. The DPE looked at me and asked what had happened, I asked him the same question. We began to look at the aircraft and we both noticed that the landing gear was still in the down position. A few minutes later a boat arrived and pulled both of us out of the water and then took us to shore. Once on shore, the DPE and I arrived at the rangers office where they called EMS and we explained what had happened.

A few days after this event I had ran through every step of the event and realized that while still in the traffic pattern I had started to use the checklist used for entering and exiting water and land environments but had become distracted by various events; Checkride jitters, DPE questioning, Pure excitement about the possibility of adding another class of aircraft to my FAA license, none of which I am not calming as an excuse.

I had not utilized my checklist and had left the landing gear in the down position which and resulted in a rapid deceleration on the water causing the floats to dig into the water causing the aircraft to flip.

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

I believe that especially in amphibian type seaplanes that all such types should have an audible gear system. Further all amphibian seaplanes should have an audible system that alerts the pilot to "gear-up" after every land take-off. This should not be a difficult app to add the any current audible gear system. When taking off from a runway the gear is down and shortly after take-off when the airspeed reaches a given speed the audible announces to "gear-up" Also floats plane should have "pull-pins" on the hinges for fast release..
