NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State time and point of departure, intended destination, and services obtained.

Cedar Valley Airport consists of three North/South runways. The center runway (17/35C) is dirt and gravel and is the runway used for all take offs and most landings. It has a small paved area to use for initiating the take off roll. The East runway is grass/sand and directly adjacent to 17/36C. The west runway is grass/sand and separated by a small ditch. (See diagram)

This flight was intended to have been in the local area. The tow pilot and I conducted a briefing earlier in the day on a prior departure and the runway and route remained the same on this departure. I estimated the wind at 5 KTS from the East which is normal and well within limits for this operation. Hand signals were used and the initial take off roll was normal with speed brakes partially extended (This is standard procedure for a high performance glider and called out for in the POH to aid in roll control until the ailerons become effective on a crosswind take off). At about this time the towplane kicked up dust as it left the asphalt surface and continued the takeoff roll on the dirt which is normal at this airport. I was offset slightly left of directly behind the towplane to maintain good visibility (Here again, normal at this airport but the dust may have provided a distraction). When I felt there was sufficient roll control I stowed the speed brakes and there was a slight drop of the right wing which was corrected for with left aileron input. The input was removed when the wings were level and at this point (Approximately 20KTS) the left wing may have come in contact with grass on the East runway which provided enough drag to turn the glider 180 degrees to the left. I never felt any contact or noticed the wing drop. At some point during this turn the safety link released and the plane was rolling backwards so I applied the wheel brake and brought the glider to a stop. I exited the glider normally and inspected for damage which was not readily apparent at first. I suspect that as the plane was rolling backwards the trailing edge of the left aileron may have caught on a clump of grass which caused it to crack at about 18 inches from the outer tip. The outer hinge pin was broken loose from the aileron but intact on the wing side.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Leaving the speedbrake open longer may have resulted in better roll control. A longer tow rope may have mitigated the effects of dust.

ADDITIONAL INFORMATION *(Please type or print in ink)*

Use this space if additional space is needed for any answers.

The glider flight times are accurate. The power flight times are conservative estimates

I HEREBY CERTIFY THAT THE ABOVE INFORMATION IS COMPLETE AND ACCURATE TO THE BEST OF MY KNOWLEDGE
